

Supplemental Figure S1. Primary cultured astrocytes (50,000 cells/well) from WT or GRKO neonates were infected with or without 1.0 MOI adenovirus expressing GFP (100% GFP expression efficiency), and co-cultured with or without microglia (50,000 cells/well) of the same genetic background, followed by stimulation with IFN- γ (10 ng/ml) for 24 hrs and quantification of secreted murine TNF- α by ELISA.
