Down-regulation of AP-1 activity in A-FOS stable clones

Clones stably transfected with A-FOS and control constructs were transiently transfected with pAP-1-luc reporter and stimulated with 10 mM glucose plus 0.2 mM cpt-cAMP for 6 h. Three different experiments were performed for each of at least three clones in each category.

Results were pooled and expressed as mean of relative luciferase activity (arbitrary units)

with s.d. as error bars. *, $p < 0.01$ vs control and vs A-C/EBP, by Student T-test.
