

Supplemental Movie Legend

Effect of PDGF-BB overexpression on tumor pericyte content.

Tumors derived from HT-29 Neo (control) and PDGF-B overexpressing tumors (HT-29 S2) tumors were stained for endothelial cells (CD31; blue), pericytes (desmin; red) and nuclei (Hoescht 33342; green). Tumors derived from PDGF-B overexpressing cells (PDGF-BB Confocal.avi) demonstrated increased pericyte content when compared to control tumors (Control confocal.avi).
