

Additional File 3 (Supplementary Figure)

Supplementary Figure S1 - Comparison of mitochondrial gene lengths among snakes and other tetrapod groups.

The total length (b.p.) is shown for all protein coding regions (A), tRNAs (B), and rRNAs (C). All snakes are in gray, while other squamates (lizards) are in black; light gray and dark gray bars are drawn under snakes species to indicate membership in the Colubroidea or Acro-Heno Clade, respectively.
