

Supplemental figure 3. CD4⁺ T cells from Hp primed and drug cured mice can transfer protection to wild type, but not stat6^{-/-} mice. 5x10⁵ CD4⁺ T cells from MLN of primed and cured mice were injected i.v. into wild type or stat6^{-/-} recipients. Two days later, the recipient mice were infected with Hp, and parasite and egg burdens determined 14 days post infection. Bars represent mean and standard error for 5 mice per treatment group.
