

Supplemental figure 1

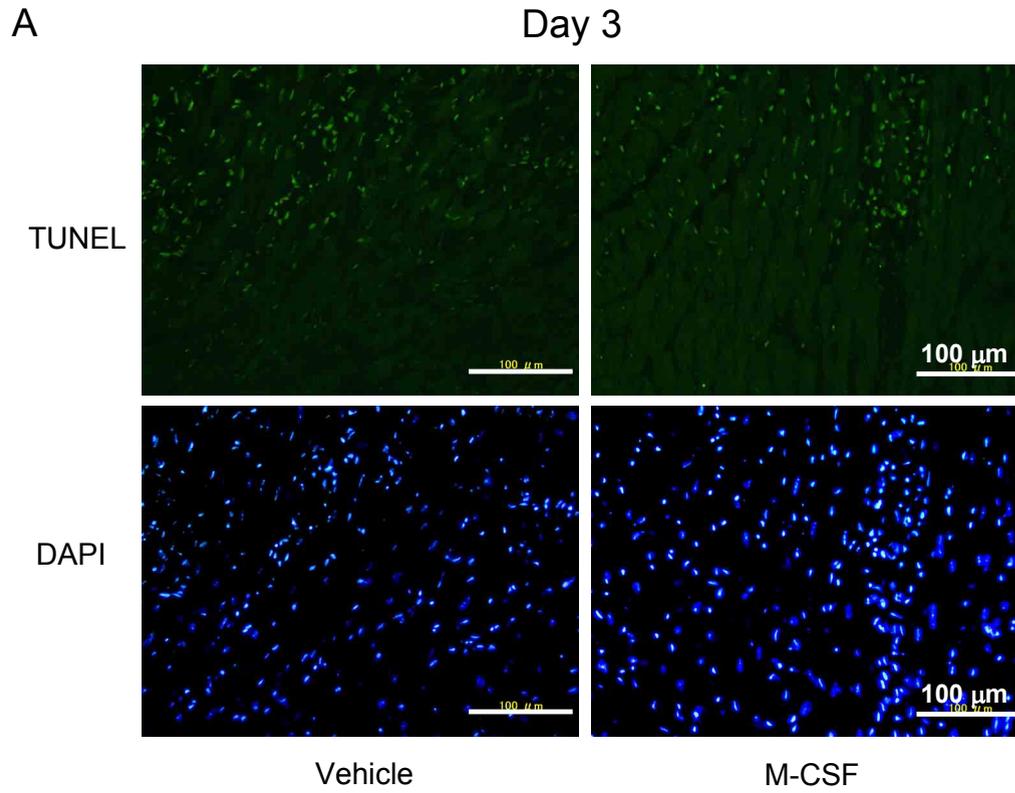

Heart sections were obtained from the vehicle- and M-CSF-treated mice at 3 and 7 days after MI, and these were stained with HE. Bar graphs indicate the MI area. Results are expressed as mean \pm SEM (each n=3).

Supplemental figure 2

(A) Heart sections were obtained from the vehicle- and M-CSF-treated mice at 3 days after MI, and these were analyzed by TUNEL staining. (B) Cardiomyocytes were stimulated with hypoxia/reoxygenation (HR) in the absence or presence of M-CSF (10 ng/mL). Nucleic acid was stained with DAPI (red: TUNEL-positive cells, blue: DAPI).
