

Supplementary figure 1

Supplementary figure 1. piRNA clusters in the mouse genome. The location of piRNA clusters in the mouse genome are indicated by data source: orange lines for dataset C, magenta triangles on the left for dataset B and green triangles on the right for dataset A. There are roughly 115 clusters ranging from 1-127 kb restricted primarily to autosomes. There is good agreement of cluster positions between the datasets and the majority of the clusters overlap in >75% of their length suggesting that most of the piRNA clusters in the mouse genome are identified.
