

Additional Figure 3. Robust knockdown in undifferentiated murine embryonic stable clones derived with 1x and 2x-TetO<sub>2</sub>pHUSH vectors. Briefly, ES cells were electroporated and selected in 1-1.5ug/mL puromycin as described in the Methods section. Clones were first selected on the basis on high TetR expression, expanded and treated ±Dox for 48 hours. Knockdown was determined by qRT-PCR.
