Each of the mammalian class E VPS factors was screened in the yeast two-hybrid assay for interaction with each of the others. The table shows the mean ± SD of optical density values obtained in a liquid β-galactosidase assay performed on three independent pools of yeast transformants. Positive signals are indicated by shading. Very weak signals obtained with GAL4-CHMP1B/VP16-CHMP1A, GAL4-ALIX/VP16-CHMP1A, and GAL4-CHMP-6/VP16-VPS4 were less than 2-fold above background and were not considered positive. Of these transformants, only the CHMP1A:CHMP1B interaction was found to be detectable by coprecipitation analysis. The GAL4 DNA-binding domain fusions of VPS28, HMP5, and Hrs were strong transcriptional activators in the absence of a coexpressed VP16-activation domain fusion protein and were therefore excluded from the analysis.
