

Supplementary Table 1: Serial mammary epithelial transplants of WT, p53+/-, and p53+/m epithelium into wildtype recipients

p53 Genotype	Number of serial transplants
p53 +/+	7* (1**) 8 (2)
p53 +/-	11 (2) 13 (1)
p53 +/m	5 (3) 11 (1)

* The values represent the number of serial transplants performed. All genotypes were transplanted into wildtype recipients. Serial transplants were terminated when ductal outgrowth encompassed less than 10% of the gland. n=3-4 donors per genotype. n=5 recipients per transplant.

**The values in parenthesis represent the number of donors which completed transplantation at this transplant generation.
