

Additional files

Additional file 1. Population differentiation based on genetic, chemical, behavioural and geographic pairwise distances.

a) Pairwise genetic distances (F_{ST}) between sampled populations of *L. neglectus*, using the six microsatellite loci (Table 2). Bold figures indicate significance after multiple comparisons, $P < 0.05$. Order of populations after geography as in Figure 4.

e) Partial correlations between genetic, chemical, behavioural and geographic distance between the *L. neglectus* populations. Correlation coefficients ($r_{x,y,z}$) are given for each plot. Mantel tests showed that correlation coefficients were only significant for behavioural distance vs. geographic, genetic and chemical distance.
