

Figure S2. Phenotype frequency of HLA allele. Observed frequencies in general population (gray bars, obtained from www.allelefreqencies.net, popstudy:Argentina-Buenos Aires) and in our study (black bars) are shown. In general, frequencies observed in our HIV-1 infected population resemble the frequencies in the general population although some alleles are overrepresented (A24, A68, B39, B07, B40, A31 and B62).
