

Paper Title: Antigen stimulation of peripheral blood mononuclear cells from *Mycobacterium bovis* infected cattle yields evidence for a novel gene expression program. Meade, K.G. et al.

Table S2: Green shaded rows detail 88 BOTL-5 microarray spot features that showed significant differential expression for the non-infected control animal group ($n = 6$) between T_3 and T_0 (3h versus 0h) post stimulation with bovine tuberculin. Yellow shaded rows detail 56 BOTL-5 microarray spot features that showed significant differential expression for the non-infected control animal group ($n = 6$) between T_{12} and T_3 (12h versus 3h) post stimulation with bovine tuberculin. [NB. Spot features are ranked by fold change for each time point comparison].
