Prepared for Environmental Science and Technology

Date: 5 March 2007

Total Pages: 9

Dissolved concentrations of Fe, As, Mn, S, P and the major cations (Na, Mg, K and Ca) are reported for both the site profiles and the incubations. Fe and As sediment concentrations from the HCl and phosphate extractions are given. The values used for the Langmuir calculations of increased surface site availability are reported.

Content:

Table S1. Site Profile Data. Dissolved concentrations of Fe, As, Mn, S, P, Na, Mg, K and Ca collected using the needle sampler in January and April 2005.

Table S2. Results of the HCl and phosphate sediment extractions.

Table S3 and Figure S1. Dissolved Fe concentrations throughout incubation.

Table S4 and Figure S2. Dissolved As concentrations throughout incubation.

Table S5 and Figure S3. Dissolved Mn concentrations throughout incubation.

Table S6 and Figure S4. Dissolved S concentrations throughout incubation.

Table S7 and Figure S5. Dissolved P concentrations throughout incubation.

Table S8 and Figure S6. Dissolved concentrations of the major cations throughout incubation.

Table S9. Groundwater volume changes for each amendment.

Table S1. Needle Sampler Profiles from Jan and April 2005
