

Table S1. Statistics of integrated regulatory networks (IRNs).

A. Type of nodes.

Node Type	Protein	TF	miRNA
Number	24174	2278	408

B. TF regulation of genes inferred from PReMod.

TFs	Edges to miRNA	Edges to TF	Edges to non-TF protein	Toatal edges
405	2190	17548	76633	96371

C. MiRNA regulations of protein genes inferred from miRanda and PicTar.

	miRNAs	Edges to protein	Edges to TF
miRanda	157	39801	7785
PicTar	178	75968	13442
Overlap	129	8629	1876

Table S2. Frequencies of network subgraphs in integrated regulatory networks compared with expected results from random simulations: A. T2m1; B. T1m2; C. T1m1g1. Elements of subgraph: square, TF; triangle, miRNA; ellipse, protein. Besides observed and expected frequencies and Z-score, we also listed P-value (fraction of simulation runs where concerned subgraph appears in the observed frequency or more. We executed 500 runs for T2m1 and T1m2, and 200 runs for T1m1g1), and number of clusters consisted of concerned subgraph members. Subgraphs sharing one or more nodes/edges are classified into the same cluster, and repeat this classification until cluster number reaches minimum. Threshold for significant motifs: Z-score ≥ 3.41 (A), 2.94 (B) and 3.01 (C) and number of clusters ≥ 5 . Different Z-score cutoff values are chosen so that their corrected probabilities of multiple (group size) testing are 0.01. Significant motifs are sorted according to their ratios. Consistent significant motifs are marked with star. Because of space limit and simplicity, only results from PReMode-based networks were listed in A, B and C. The consistent motifs from all 4 data sets were presented in D.

Table S7. Top 5 biased functions to each of two TF classes that regulate two miRNA classes respectively: GO items with positive Z-score prefer class I and negative for class II. All GO items associated with transcription factor are excluded. We found 943 GO items associated with class I TFs, and 225 GO items for class II TFs. Percentages of concerned GO among total GO items are denoted as p_I for class I and p_{II} for class II, and p is the expected percentage for both groups.

Figure S1. Distribution of TF-miRNA co-regulation Z-scores. Z-score for any pair (assuming TF i and miRNA j) is calculated as followed. For each gene, it has a probability $p_{tfi} = T_{tfi} / N_{gn}$ to be regulated by TF i , where T_{tfi} : number of target protein genes by TF i , and N_{gn} : total protein genes. Similarly, the probability for this gene being regulated by miRNA j is $p_{mij} = T_{mij} / N_{gn}$, where T_{mij} : number of target protein genes by miRNA j . Expected number of genes co-regulated by TF i and miRNA j is $N_{gn} p_{ij}$ (where $p_{ij} = p_{tfi} p_{mij}$) and standard deviation is $\sqrt{N_{gn} p_{ij} (1 - p_{ij})}$. Thus, Z score is $Z_{tfi:mij} = (T_{tfi:mij} - N_{gn} p_{ij}) / \sqrt{N_{gn} p_{ij} (1 - p_{ij})}$, where $T_{tfi:mij}$ is number of observed protein genes co-regulated by this TF-miRNA pair.

Figure S2. Network motif profile of miRNAs: **A.** PicTar data set; **B.** miRanda data set. A network subgraph is represented by a six-bit number. Six bits denote six states respectively: miRNA regulating TF 1, TF 1 regulating miRNA, TF 1 regulating TF 2, miRNA regulating TF2, TF 2 regulating miRNA and TF 2 regulating TF 1. Each state has two values: 1 (regulation exists) and 0 (regulation does not exist). For example, 100100 denotes the subgraph where two TFs regulated by a miRNA.

Figure S3. Expression difference between class I and II miRNAs in tumor (T) and normal (N) tissues: a bar is averaged rank of class I miRNAs subtracted by that of class II miRNAs. Positive sign indicates higher expression of class II miRNAs and negative for class I. Other abbreviations used: BLDR, bladder; BRST, breast; KID, kidney; Lvr, liver; MELA, melanoma; MESO, mesothelioma; PAN, pancreas; PROST, prostate; UT, uterus.

TF-miRNA co-regulation
