

Supporting Information

Guisinger et al. 10.1073/pnas.0806759105

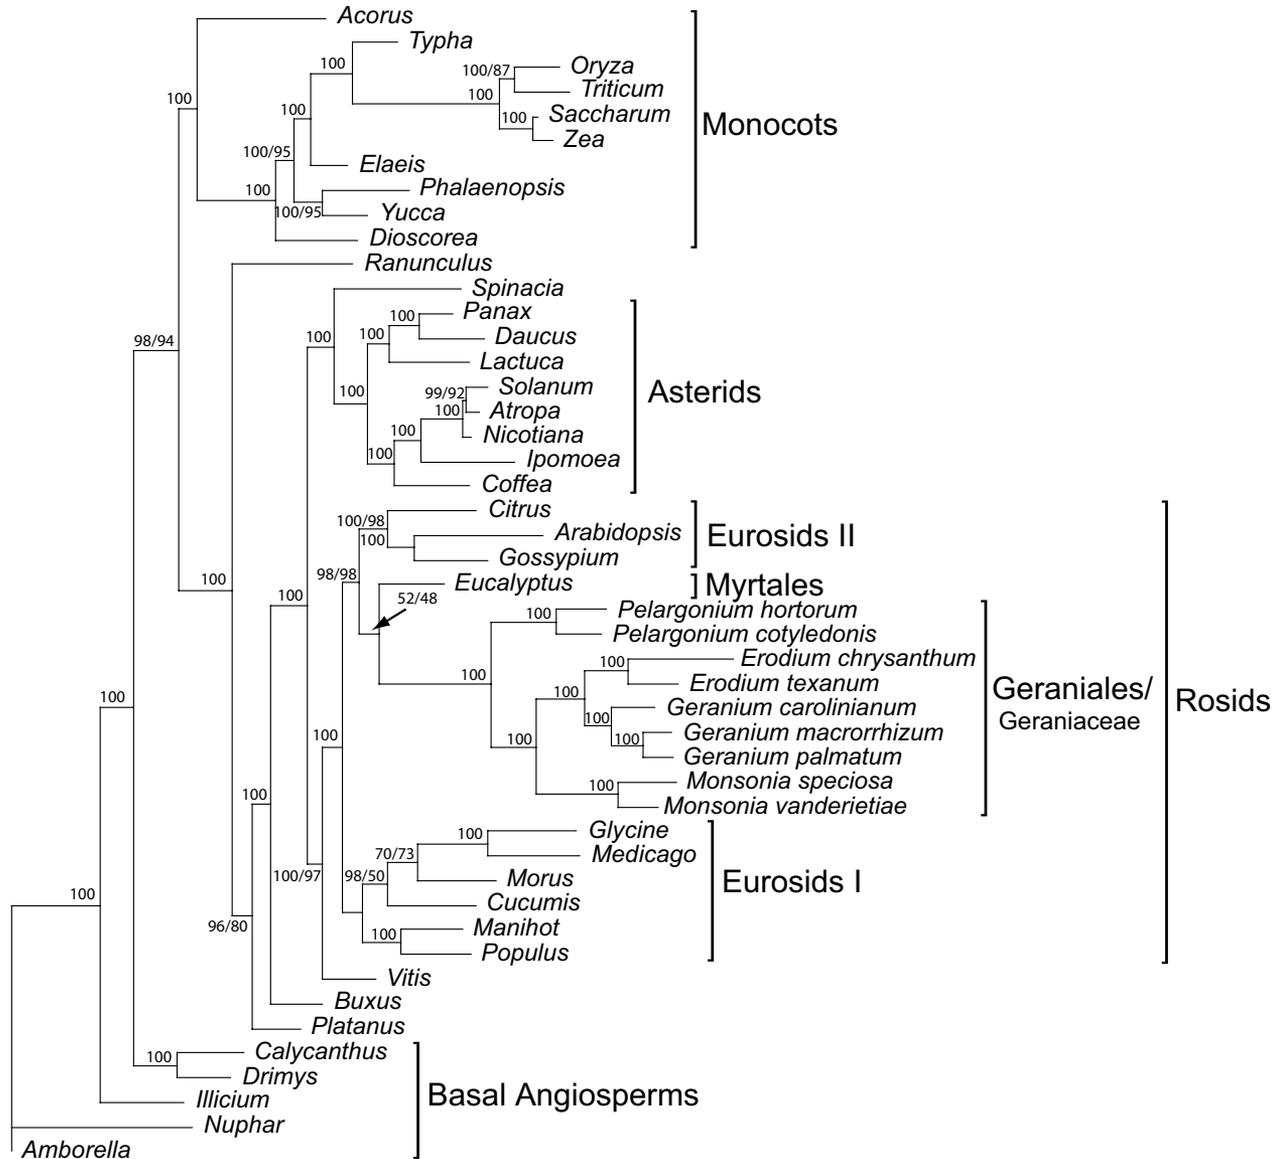

Fig. S1. ML tree inferred from 72 genes from 47 taxa ($-\ln L \mu = 607633.5555$, $\sigma = 0.001$). Bootstrap values for ML and MP, respectively, are shown at nodes. When ML and MP values are the same, only one value is reported.

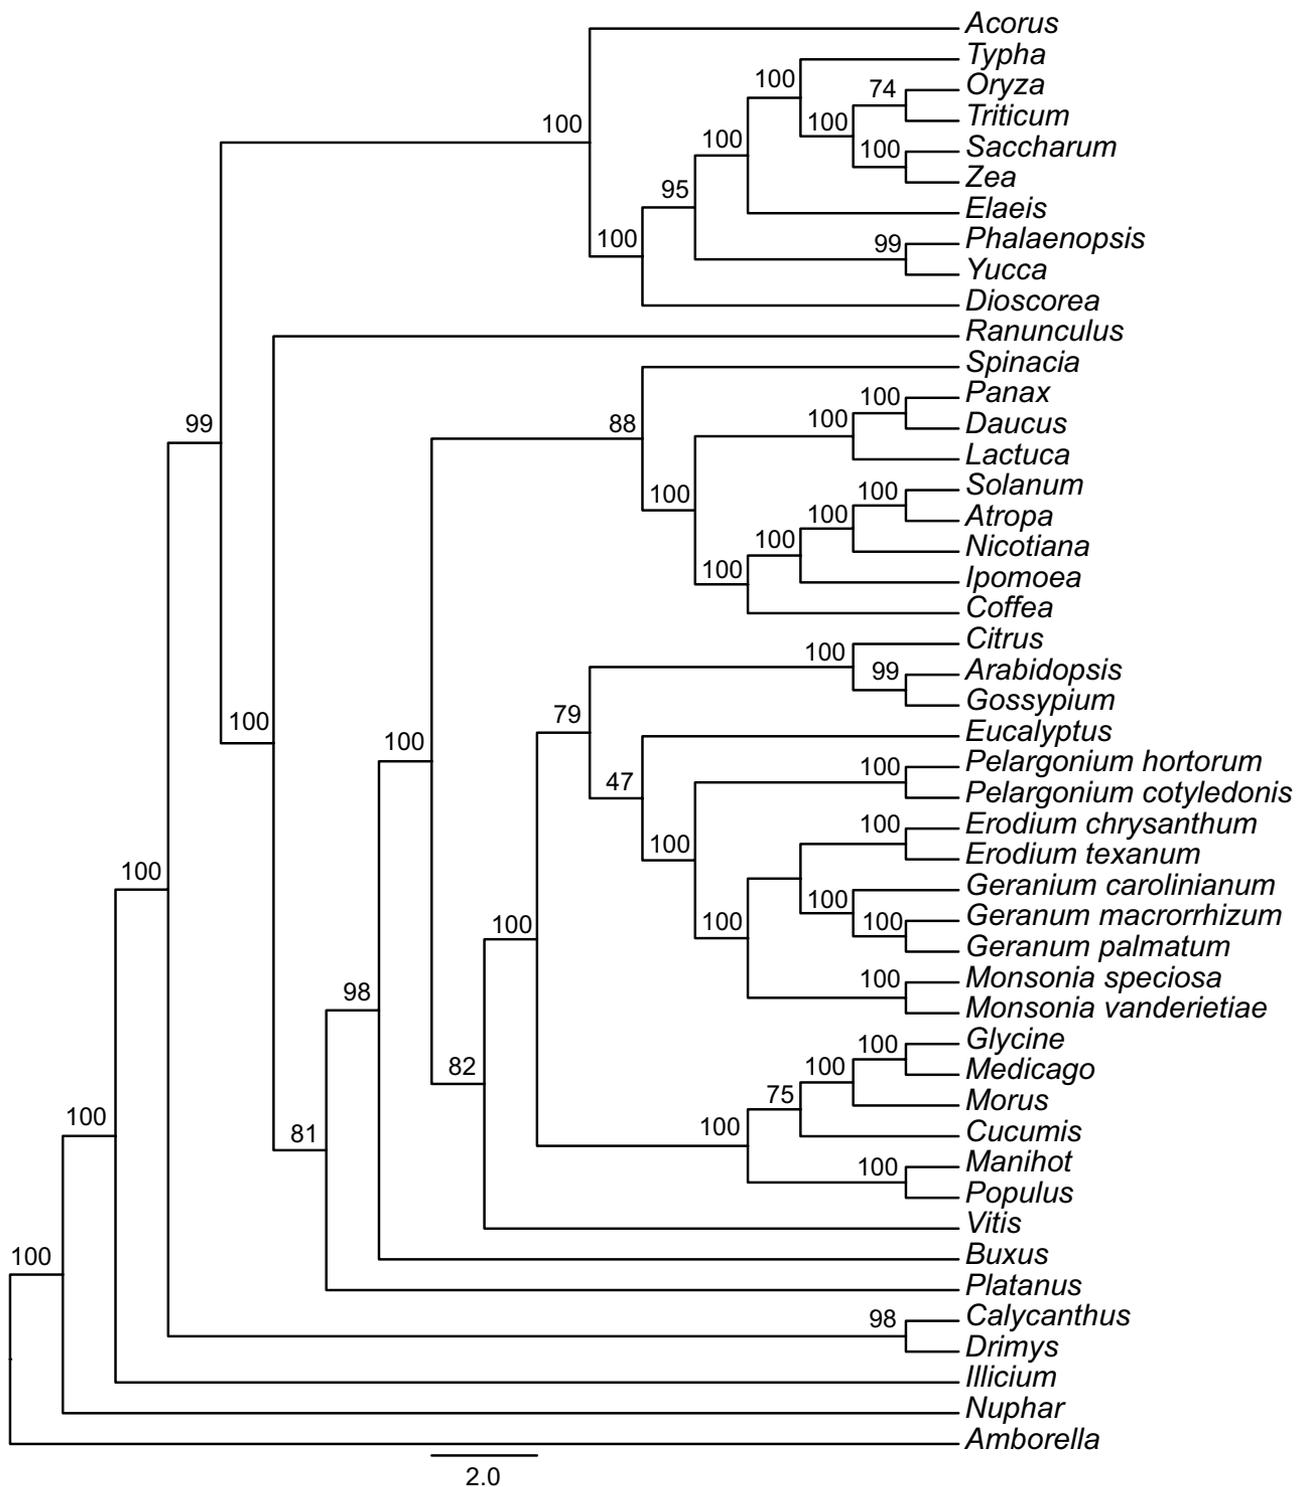

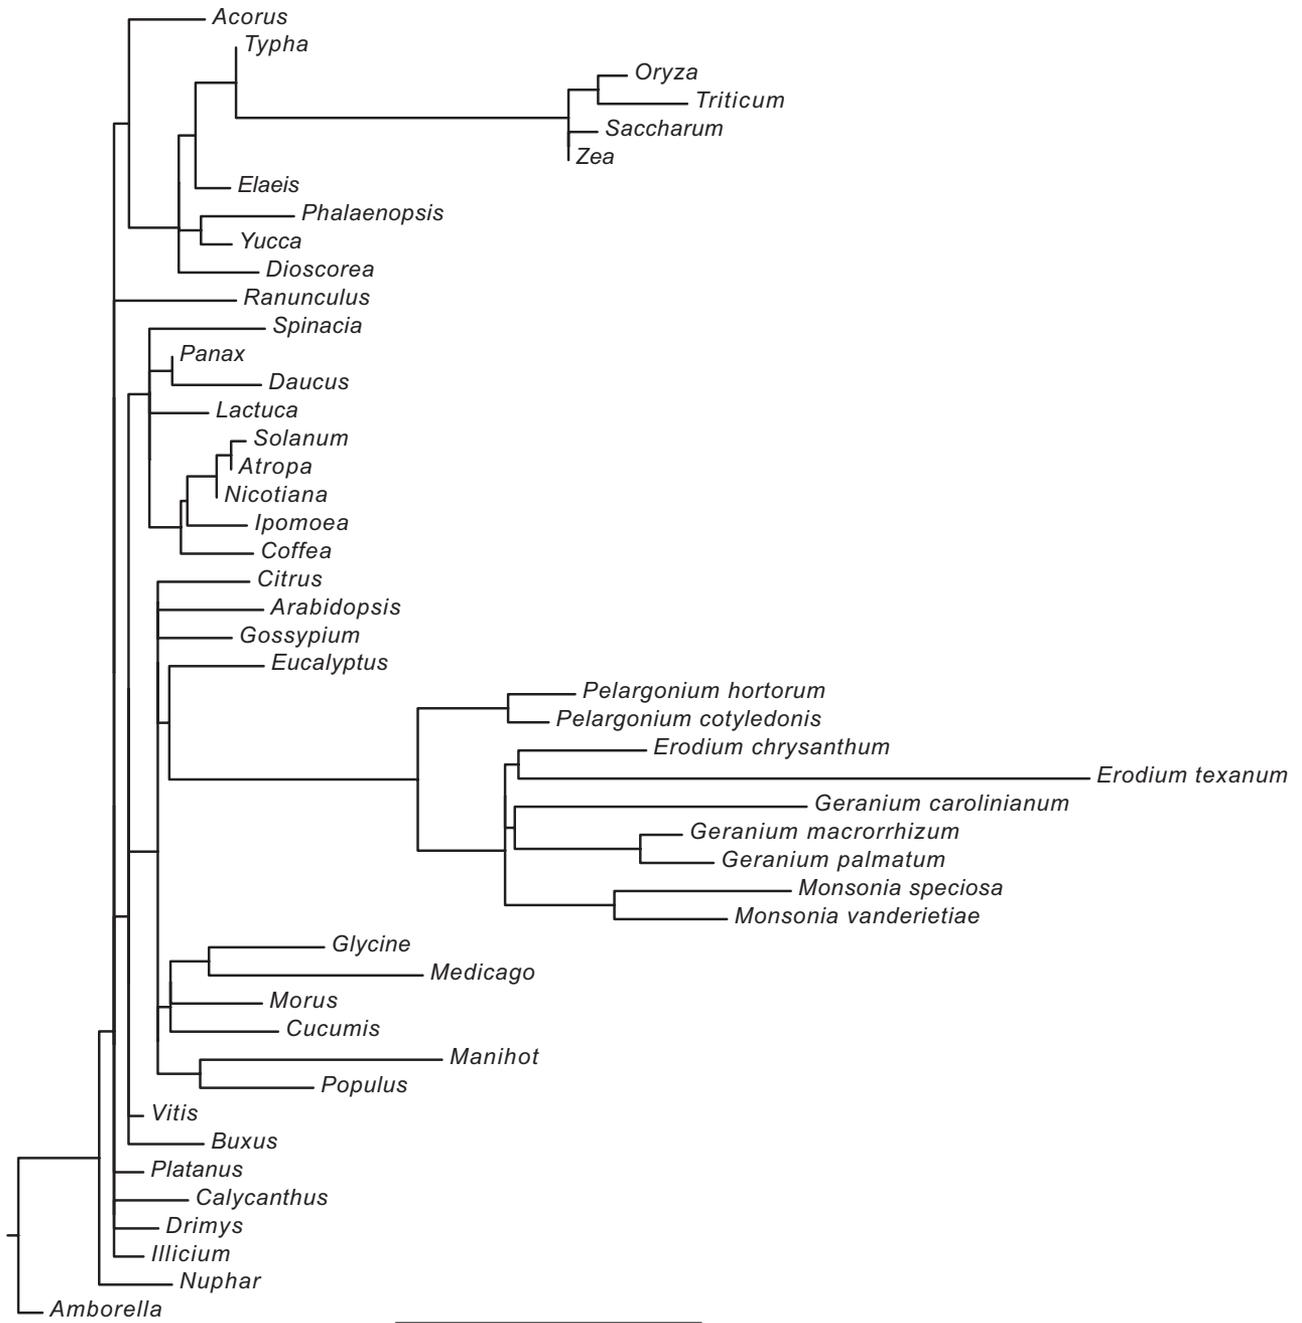

Fig. S2. ML tree inferred from 27 slowly evolving genes for 47 taxa ($-\ln L = 125333.7228$). ML bootstrap values are shown at nodes. Genes included *petA*, *petB*, *petD*, *petG*, *petL*, *petN*, *psaA*, *psaB*, *psaC*, *psal*, *psaj*, *psbA*, *psbB*, *psbC*, *psbD*, *psbE*, *psbF*, *psbH*, *psbl*, *psbj*, *psbK*, *psbL*, *psbM*, *psbN*, *psbT*, *psbZ*, and *rbcl* and were chosen based on Wolfe *et al.* (1) and Moore *et al.* (2).

1. Wolfe KH, Li WH, Sharp PM (1987) Rates of nucleotide substitution vary greatly among plant mitochondrial, chloroplast, and nuclear DNAs. *Proc Natl Acad Sci USA* 84:9054–9058.
2. Moore MJ, Bell CD, Soltis PS, Soltis DE (2007) Using plastid genome-scale data to resolve enigmatic relationships among basal angiosperms. *Proc Natl Acad Sci USA* 104:19363–19638.

E.chrysanthum = *Erodium chrysanthum*, *G.carolinianum* = *Geranium carolinianum*, *P.hortorum* = *Pelargonium X hortorum*, *P.cotyledonis* = *Pelargonium cotyledonis*. Missing data and gene exclusions are described. Two genes, *clpP* and *infA*, were excluded, because we were unable to align either amino acid or nucleotide sequences. Additionally, some genes are missing from various genomes. The majority of the NADH dehydrogenase genes (*ndhA*, *ndhC*, *ndhD*, *ndhE*, *ndhG*, *ndhH*, *ndhI*, *ndhJ*, and *ndhK*) are missing in *E. chrysanthum*. Incomplete genome sequences result in missing data for *psbD* in *G. carolinianum* and 24 nucleotides of *rbcL* in *E. chrysanthum*. In addition, a functional copy of the RNA polymerase gene *rpoA* is missing in *P. cotyledonis* (M. Guisinger, unpublished) and *P. hortorum* (1). Previously published intron losses that were either confirmed in our study or found in additional taxa included the loss of the introns in *rpl16* and *rps16* in all Geraniaceae (1, 2) and in *rpl2* in *Monsonia speciosa* and *M. vanderietiae* (previously *Sarcocaulon vanderietiae*) (3). The loss of the *rpoC1* intron in *E. chrysanthum* has not been previously described. Genes that contain internal stop codons, and are therefore shortened in the alignment, include *atpE* in *Monsonia speciosa* and *M. vanderietiae*, *ndhB* and *ndhF* in *E. chrysanthum*, *rpl22* in *G. palmatum*, *rpl23* in *G. palmatum* and *G. macrorrhizum*, *rpoB* in *G. macrorrhizum*, and *rpoC1* in *G. carolinianum*.
