

## Supplementary Methods

*Microarray data preprocessing and differentially expressed genes selection:* After hybridization, the Illumina HumanWG-6 BeadChip was analyzed by the Gene Expression Module of BeadStudio Software (Illumina). Raw intensity and present/absent call of each probe was obtained for the 6 hybridized samples and exported in 1 comma-separated file. We used R [1] and BioConductor Lumi package [2] to examine the quality control information and perform pre-processing on the raw data. Variance stabilizing transformation (VST) and robust spline normalization (RSN) were applied on the raw data to generate normalized and comparable data among samples. After normalization, we used inverse VST to transform intensity data back to the raw scale before computing ratios between samples.

We performed statistical analysis to select differentially expressed genes between cell lines shCNTL and shHDAC3, using ratios to make comparisons. A ratio is derived by dividing the intensity of the test sample over the intensity of the control sample. Probes whose ratio is greater than 2 fold are considered up-regulated and probes whose ratio is less than 0.5 fold are considered down-regulated.

*Pattern-based Clustering:* We used Pattern-based Clustering as an approach to perform functional analysis by grouping genes with similar expression pattern into groups. Pattern-based Clustering uses non-numeric parameters assigned for each fold change pattern to group genes in order to avoid assigning pre-defined clustering number and common inconsistency problems in distance-based clustering algorithms such as K-means.

*Finding over-represented Gene Ontology (GO) terms:* Pattern-based Clustering generates patterns based on the input genes and their expression data. For some interesting patterns, we used R and GOstats package [3] to find over-represented Gene Ontology terms in Biological Process hierarchy. This functional analysis will find if certain GO Biological Processes are associated with a certain expression pattern. It may also find if certain genes in this cluster are involved together in an over-represented GO Biological Process.

Given a set of genes, GOstats performs functional analysis based on the association of Gene Ontology (GO) terms to genes. It uses a Hypergeometrical model to find over-represented GO terms for the given set of genes compared to the universe. We used BioConductor illuminaHumanv2 library as the universe as it matches with the Illumina chip used in this experiment. We tested two gene lists, genes upregulated by in shHD3 cells compared to shCNTL, and genes downregulated by shHD3 compared to shCNTL.
