

**Additional file 4 - Phylogenetic relationships among genotypes in a population of *G. intraradices***

Neighbour-network using uncorrected  $p$  distance showing reticulate phylogenetic branching among a core set of genotypes. Bootstrap support of branches above 90% is indicated in % of 1000 replicates. Analyses were performed with two different restrictions. A. All indels were removed and only substitutions were considered in the analysis. B. Strongly divergent genotypes (XI, XV-XVIII) were removed from the analysis.
