

Fig. 1. Binding of the hairpin region in the StAR promoter to endogenous DAX-1 using MA-10 NE. NE (15 mg) obtained from untreated MA-10 cells was incubated with the ^{32}P -labeled probe (-48/-16) encompassing the hairpin loop (lanes 1-4). The specificity of DAX-1 binding was assessed with its unlabeled sequence (lane 2), or Abs to DAX-1 (lane 3) and CREB (lane 4). Data are representative of three independent experiments.
