

Supplemental Figure 1. Relative response ratios of diurnal-like and extended dark period of root metabolites from wild-type tomato plants (*Solanum lycopersicum* cv. Moneymaker). The plants were five-weeks old and samples were taken from mature root tips. Selected amino acids (A, D), organic acids (B, E) and sugar and polyols (C, F) are depicted in the graphs. The shaded areas are representative of the dark period, with the values representative of the mean \pm SE of four individual plants per time treatment; an asterisk (*) indicates values determined by the *t*-test to be significantly different from those normalised to the t₀ timepoint ($P < 0.05$).

Supplemental Figure 2. Relative response ratios of diurnal-like and extended dark period of exudates collected from wild-type tomato plants (*Solanum lycopersicum* cv. Moneymaker). The plants were five-weeks old and samples were taken from mature root tips. Selected amino acids (A, D), organic acids (B, E) and sugar and polyols (C, F) are depicted in the graphs. The shaded areas are representative of the dark period, with the values representative of the mean \pm SE of four individual plants per time treatment; an asterisk (*) indicates values determined by the *t*-test to be significantly different from those normalised to the t₀ timepoint ($P < 0.05$).

Supplemental Table S1. Relative root exudates of FL and mMDH antisense lines collected at the end of the light period. Metabolites were determined as outlined in „Material and Methods“. The data set were normalised with respect to the wild type, and expressed per whole plant root FW. Values are presented as mean \pm SE of six individual plants per line; values set in bold type were determined by the *t*-test to be significantly different ($P < 0.05$) from the wild type (WT).

Supplemental Table SII Absolute endo-metabolites concentrations (mmol.g⁻¹ FW) of mature root tips determined in 5 week-old transgenic FL and mMDH lines. Values are presented as mean ± SE of six individual plants per line; values set in bold type were determined by the *t*-test to be significantly different (*P*<0.05) from the wild type (WT).

Supplemental Table SIII Absolute exudate concentrations (mmol g⁻¹ FW) of root exo-metabolites recovered at the end of the light period from transgenic FL and mMDH antisense lines. Values are presented as mean ± SE of six individual plants per line; values set in bold type were determined by the *t*-test to be significantly different (P<0.05) from the wild type (WT).
