

Supplemental Data Figure S1: Scatter plot of Night/Day pineal gene expression in experiment A vs. expression in experiment C. This graph compares signal strengths for genes that have at least one probe set on both the RG_U34A (Exp. A) and Rat230_2 (Exp. C) microarrays; probe sets are not necessarily the same on both microarrays. Only probe sets with greater than 2-fold night/day change, $FDR < 0.20$ and called "present" in 3 out of 4 replicates of either group are shown. Data points are taken from Supplemental Data Table S1.
