The Median Probability Age reported is derived from the radiocarbon calibrations which were done using a ΔR of -28 ± 4 ^{14}C years [(Druffel ERM, et al. (2001) Changes of subtropical North Pacific radiocarbon and correlation with climate variability. *Radiocarbon* 43:15–25]Druffel et al. 2001), the CALIB 5.0 (Stuiver & Reimer 1993)[Stuiver M, Reimer PJ (1993) Extended ^{14}C database and revised CALIB V5.0 radiocarbon calibration program. *Radiocarbon* 35:215–230] computer calibration program and the marine04 calibration dataset (Hughen et al. 2004[Hughen KA, et al. (2004) Marine04 Marine radiocarbon age calibration, 26–0 ka BP. *Radiocarbon* 46:1059–1086]).

≈Microtomed (100-μm intervals) specimens; see Figs. 2A and 3.

*Radial transects from outer edge to center in ~0.5-mm increments; see Fig. 5.

†Results published in Roark et al., 2006, MEPS Vol 327: p1–14.

‡Sample was collected alive, thus the outer most age assigned is the collection year.

§Post-bomb data are reflected by positive $\Delta^{14}\text{C}$ values. AD years were determined by comparison with a Hawaiian surface water $\Delta^{14}\text{C}$ time-series. See Fig. 2.
