A-F2 represent the sequence of primers used for cloning and insertion of *spc* cassette in *E. coli* *nuoH* gene. The italicized bases represent the introduced restriction sites *Sma*I and *Sal*I (in case of A and D, respectively) and HindIII (in case of B, C, E2 and F2). The underlined bases were altered from *E. coli* DNA. From E36A onwards, the sequence represents the primers used for the introduction of a site-specific mutation and the underlined bases represent mutations.
