

Supplementary Information

Supplemental Figure S1. Loss of some Paf1C components reduces [*PSI*⁺]-mediated nonsense suppression. Deletions of *RTF1*, *CDC73*, and *LEO1* were made in the following strains: strong (s) [*PSI*⁺], weak (w) [*PSI*⁺], [*psi*⁻], and SV16. Each deletion mutant and parental wild type control strain was spotted as described in the legend of Figure 3.

Supplemental Figure S2. Deletion of *CTR9* results in reduced nonsense suppression in the OT69 strain harboring a mutation in *sup45* (E415X). Liquid cultures were normalized to equal cell density and five-fold serial dilutions were spotted onto YPD and SD-ade medium. Deletion of *CTR9* was confirmed by colony PCR and western blot.

Supplementary Figure S2
