

## SUMMARY

1 The diagnosis and staging of lung cancer often begins with the assessment of a suspect periph-  
2 eral chest site. Such suspicious peripheral sites may be solitary pulmonary nodules, diffuse masses,  
3 or other abnormally appearing regions of interest (ROIs). The state-of-the-art process for assessing  
4 such peripheral ROIs involves off-line procedure planning using a three-dimensional (3D) multi-  
5 detector computed tomography (MDCT) chest scan followed by bronchoscopy with an ultrathin  
6 bronchoscope.  
7  
8  
9

10 The current practice for planning bronchoscopic procedures requires the physician to scroll  
11 through two-dimensional (2D) transverse-plane sections of the MDCT image on a computer console  
12 and perform 3D mental reconstruction of the anatomy. Unfortunately, mentally defining routes is  
13 an arduous, error-prone process. Even if an accurate route is defined through 3D MDCT analysis,  
14 the physician must navigate the bronchoscope — with no direct MDCT-based assistance — through  
15 the complex bifurcating airway tree to reach a site. These factors make bronchoscopy of peripheral  
16 sites difficult. Recent research has shown that virtual bronchoscopic guidance can enable physicians  
17 to reliably perform follow-on ultrathin bronchoscopic procedures. The current manual process  
18 for generating peripheral VB guidance data, however, is time-consuming and laborious for the  
19 physician.  
20  
21  
22  
23  
24  
25  
26  
27  
28

29 We present an integrated computer-based system for planning peripheral bronchoscopic proce-  
30 dures. The system takes a 3D MDCT chest image as input and requires seven processing steps: (1)  
31 ROI selection; (2) ROI Definition; (3) Airway-Tree Segmentation; (4) Airway Surface Definition;  
32 (5) Centerline Analysis; (6) Route Planning; and (7) Airway-Tree Editing. The system performs  
33 nearly all operations automatically, with the only interaction required by the physician being step  
34 (2), ROI Selection. The system is computationally efficient and fits smoothly within the clinical  
35 work flow. Integrated into the system and described in detail in the paper is new surface-definition  
36 method, which is vital for effective analysis and planning to peripheral sites.  
37  
38  
39  
40  
41  
42  
43

44 Results demonstrate the efficacy of the system, the impact of the new surface definition method,  
45 the system's applications to the subsequent live guidance of ultrathin bronchoscopy to the periphery.  
46 We have tested the system on over 40 human cases to date, with 14 cases having undergone full  
47 live guidance of bronchoscopy to the periphery. Results show that the system requires less than 15  
48 minutes to generate planning data.
