Univariate correlations analyses between SNPs (coded 1, 2, 3 in alphabetical order for A, C, G and T with 2 for the heterozygote) and age and BMI-adjusted serum sex steroid levels in the comprehensive screening in the GOOD study were performed using Pearson's correlation. Association between 604 genetic markers in 50 sex steroid-related genes (1-50) and serum estradiol (E2), estrone (E1) and testosterone (T) were evaluated in young adult men (GOOD, n = 1041).
