

Suppl. Table 6 FWHM changes in the widening of the plasmalemma-bound GFP fluorescence signal in aquaporin-GFP expressing hypocotyl and root cells before (0 min) and 30 min after application of 10 nM BL (30 min.). The statistical analysis revealed a change of the cell wall width by $10 \pm 8\%$ ($n = 12$, $p = 0,187$). The measurements were performed on 12 independent cells derived from 3 independent seedlings.
