

Figure S2

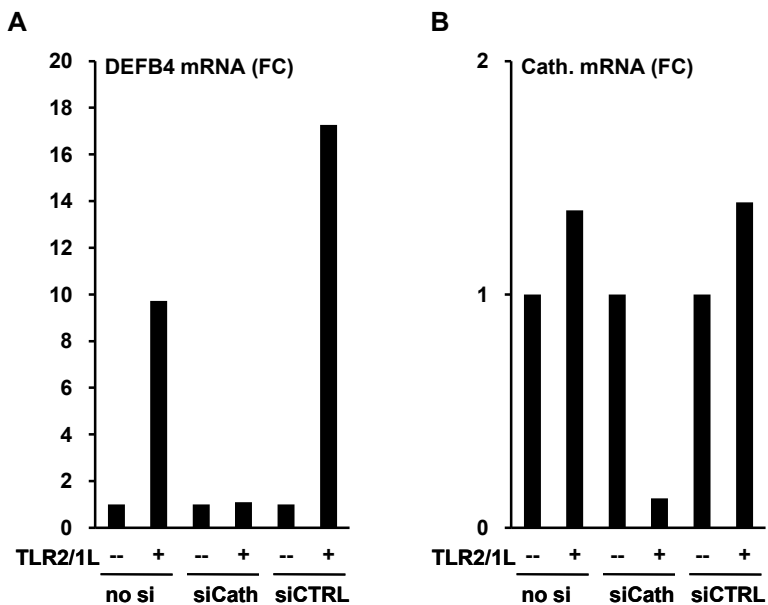

Figure S2. Monocytes were transfected with either siRNA oligos specific for DEFB4 (siDEFB4) or cathelicidin (siCath) as well as a non-specific siRNA oligo (siCTRL) or no siRNA. The cells were then stimulated with the TLR2/1L for three days. Levels of (A) DEFB4 or (B) cathelicidin mRNA were determined using qPCR. Data shown is representative of three separate experiments.
