A

B

Fig. S1. Material presented during motor act observation (A) and execution (B). Each row shows one of the 8 different motor acts. Columns in A correspond to the movie frames shown at 250, 500, 1,000, 1,250, and 1,500 ms.

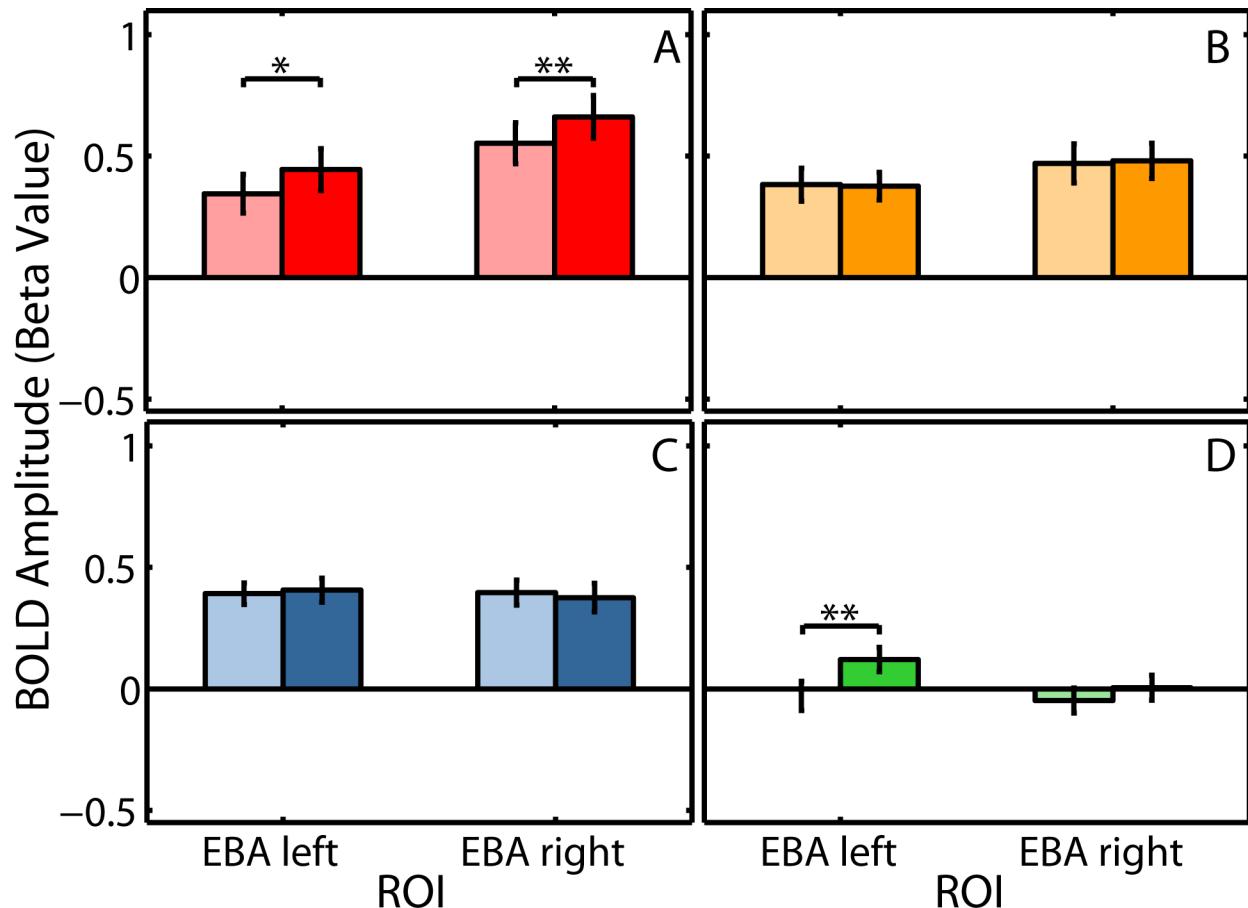

Fig. S2. Average BOLD response in left and right extrastriate body area (see also Table S1). The BOLD response adapted in both ROIs if the same motor act was repeatedly observed (A). Furthermore, there was adaptation in the left EBA if the same motor act was repeatedly executed (D). We found no signs of cross-modal adaptation in the left or right extrastriate body area (B and C). Light colors, same motor act; dark colors, different motor act. *, $P < 0.05$; **, $P < 0.01$. Error bars show SEM.

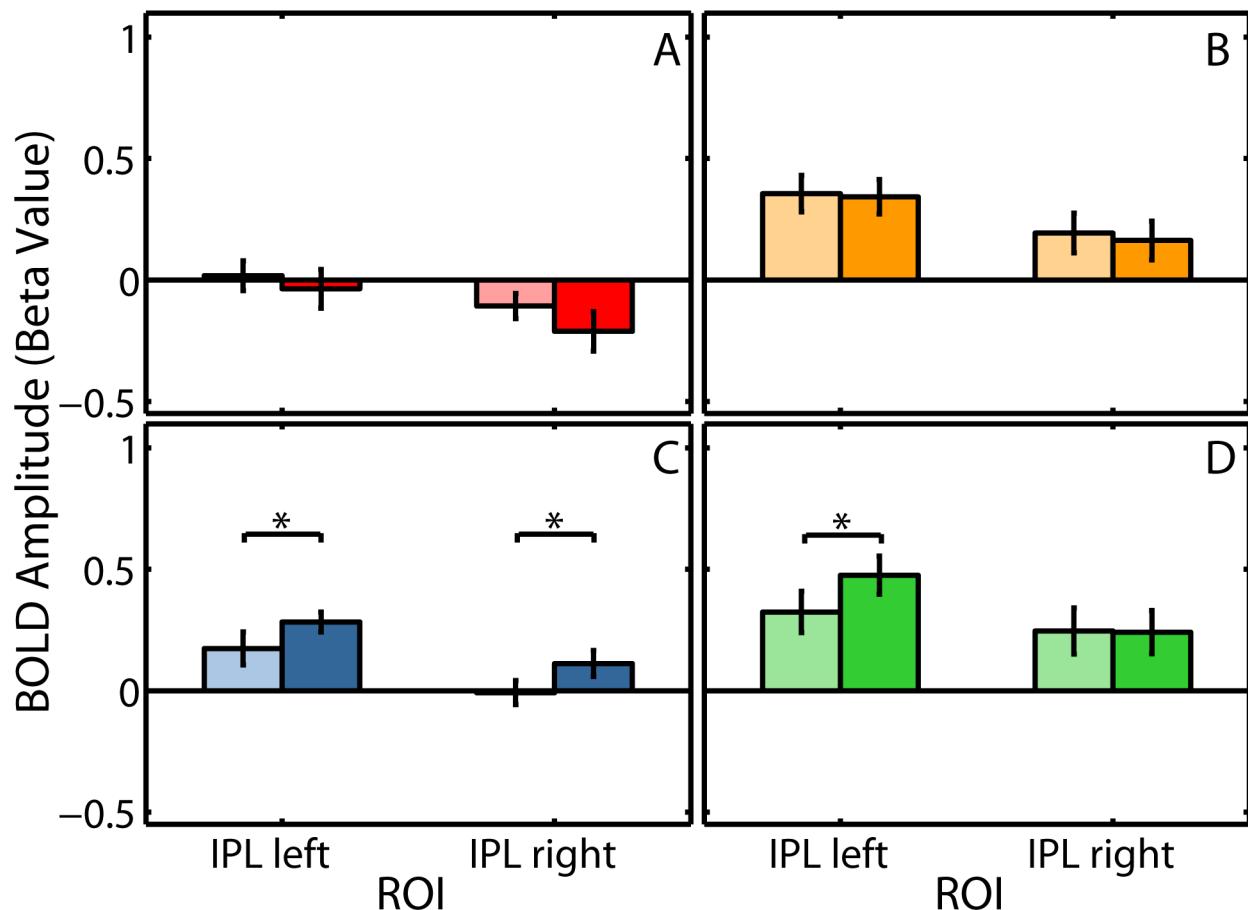

Fig. S3. Average BOLD response in left and right inferior parietal lobule (see also Table S2). No adaptation was found if the same motor act was repeatedly observed (A) or if the same motor act was first executed and then observed (B). If the same motor act was first observed and then executed, the BOLD response adapted in left and right inferior parietal lobule (C). If the same motor act was repeatedly executed, the BOLD response in left inferior parietal lobe adapted (D). Light colors, same motor act; dark colors, different motor act. *, $P < 0.05$; **, $P < 0.01$. Error bars show SEM.

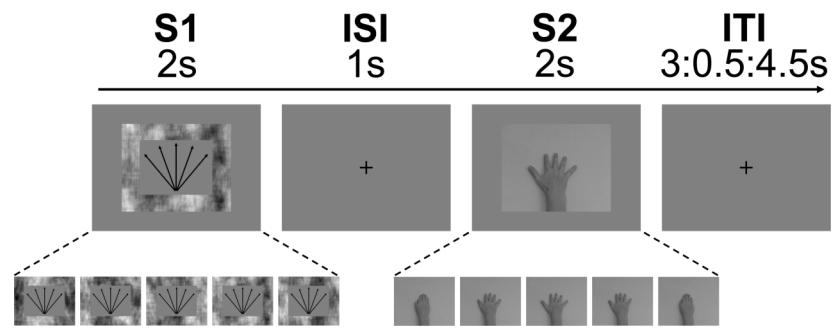

Fig. S4. Trial scheme. Each trial consisted of an adaptation (Video S1) and a test stimulus (Video S2). The example shows a trial for the condition “OE-same” (Video S1, “observe motor act”; Video S2, “execute” same motor act).

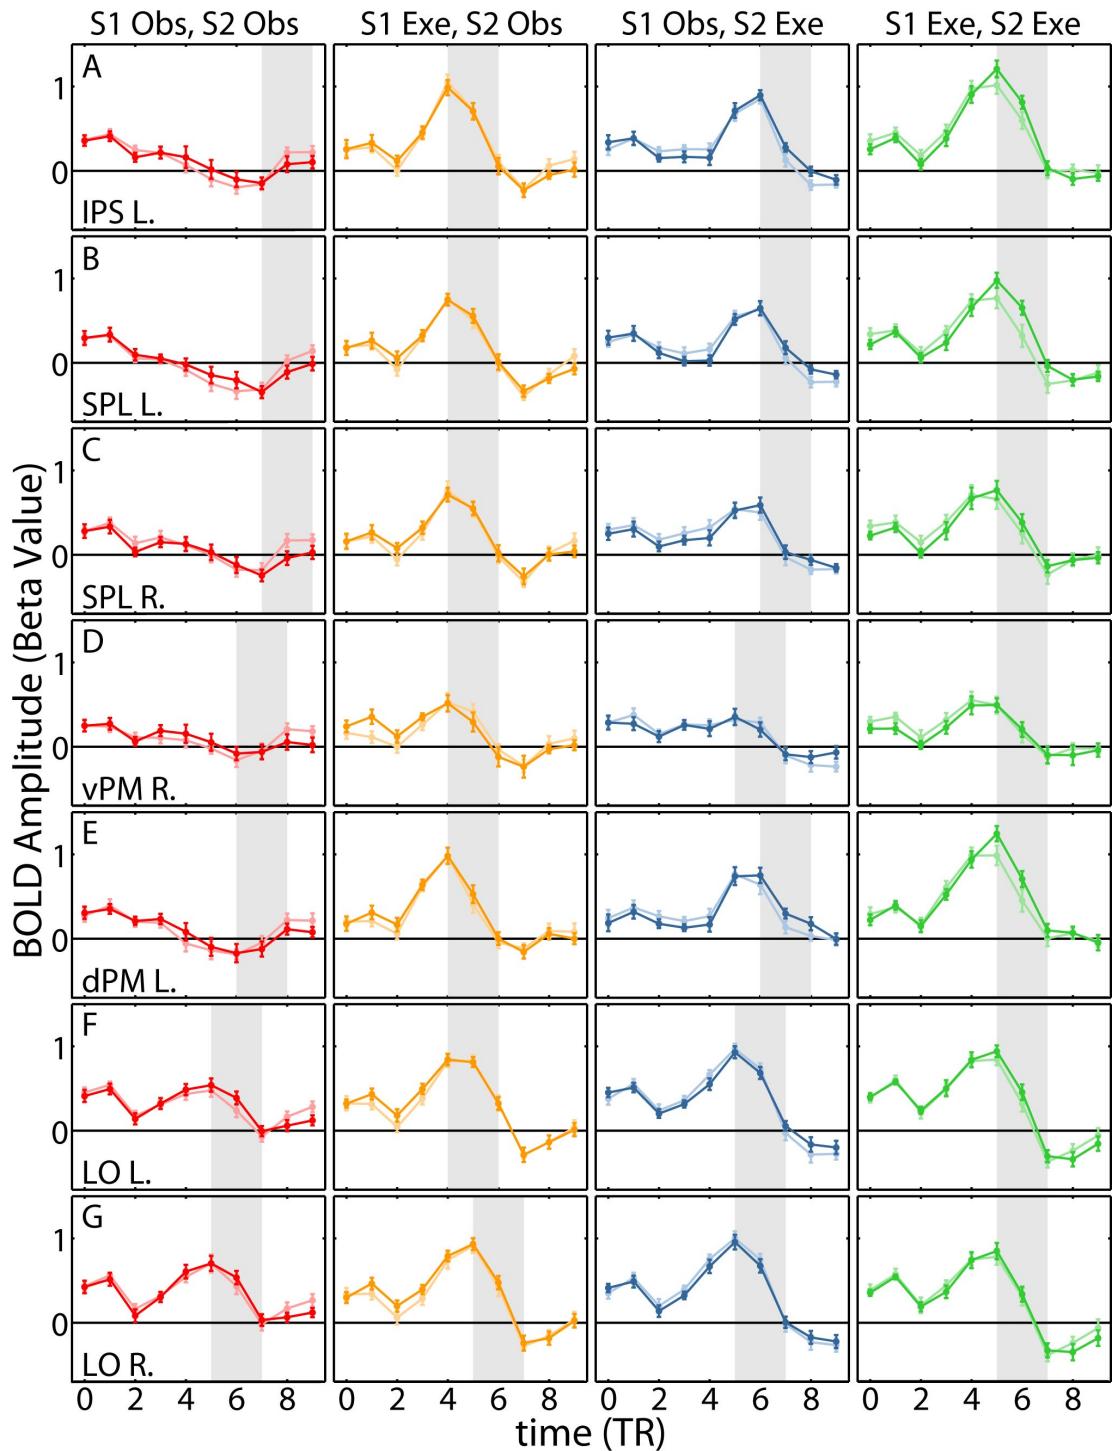

Fig. S5. Event-related deconvolved BOLD response (averaged across trials and participants for all voxels in each ROI) in visuomotor ROIs (A–G), separately for each condition (columns). Light colors, same motor act; dark colors, different motor act. Time window for averaging is marked in gray. Error bars indicate SEM. TR = 0 indicates trial onset. IPS L., left intraparietal sulcus; SPL L., left superior parietal lobule; SPL R., right superior parietal lobule; vPM R., right ventral premotor cortex; dPM L., left dorsal premotor cortex; LO L., left lateral occipital cortex; LO R., right lateral occipital cortex.

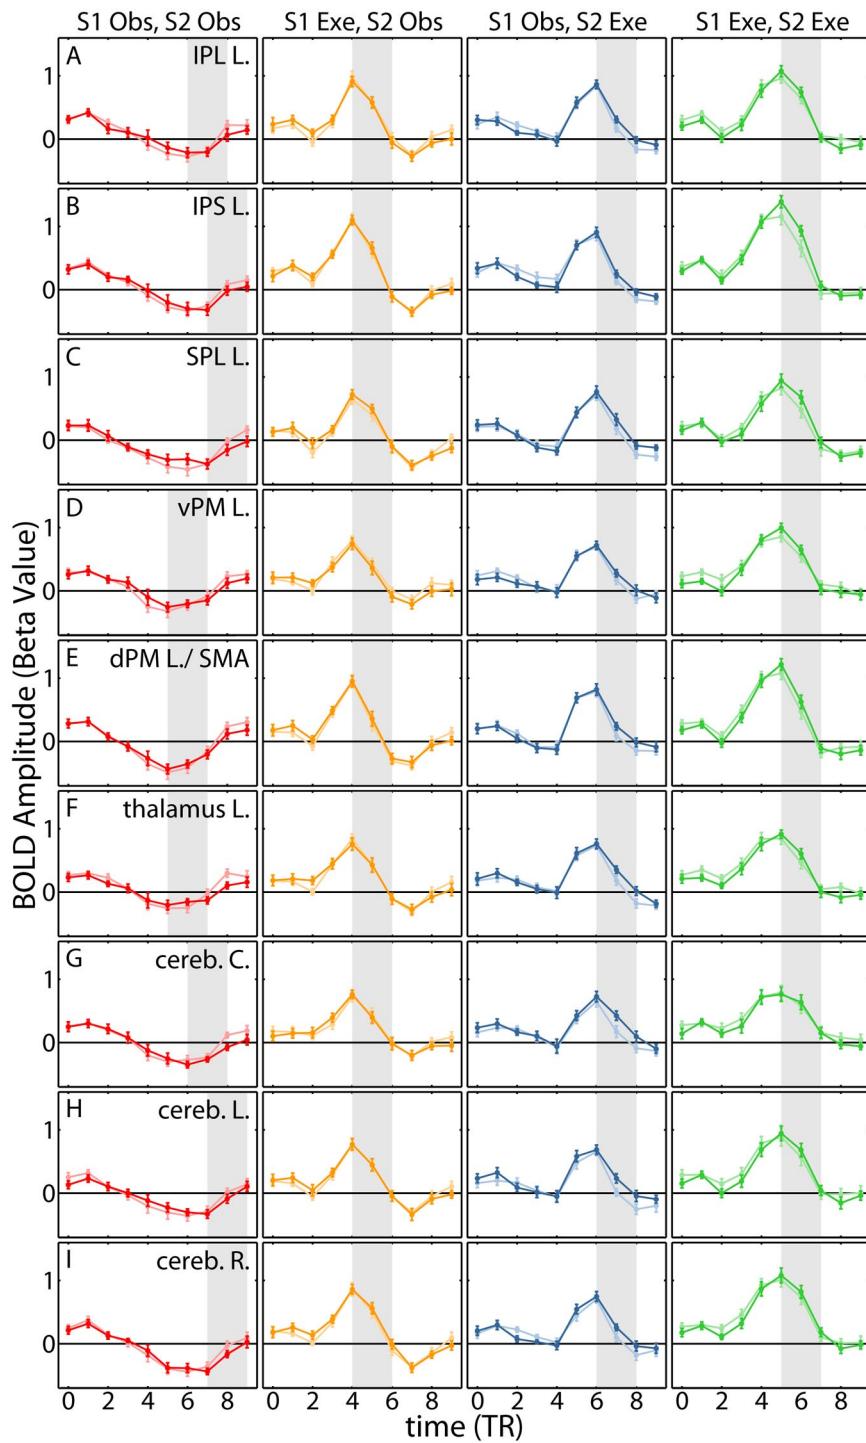

Fig. S6. Event-related deconvolved BOLD response (averaged across trials and participants for all voxels in each ROI) in motor ROIs (*A–I*), separately for each condition (columns). Light colors, same motor act; dark colors, different motor act. Time window for averaging is marked in gray. Error bars indicate SEM. TR = 0 indicates trial onset. IPL L., left inferior parietal lobule; IPS L., left intraparietal sulcus; SPL L., left superior parietal lobule; vPM L., left ventral premotor cortex; dPM L./SMA, left dorsal premotor cortex/supplementary motor cortex; cereb. C., central cerebellum; cereb. L., left cerebellum; cereb. R., right cerebellum.

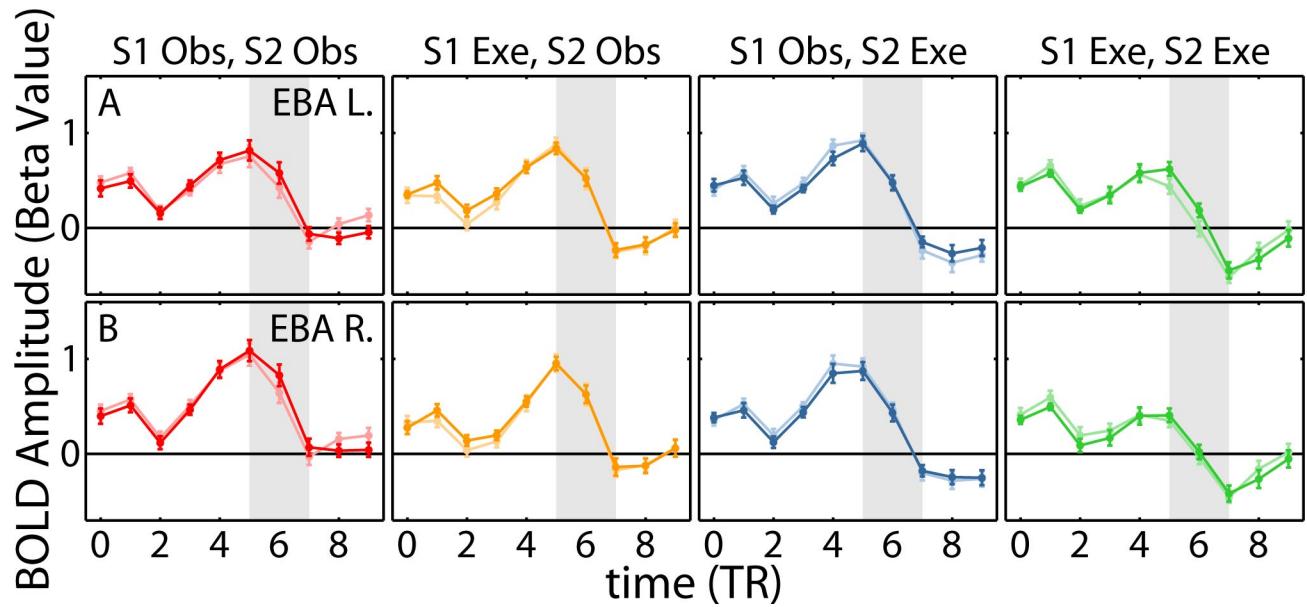

Fig. S7. Event-related deconvolved BOLD response (averaged across trials and participants for all voxels in each ROI) in visual ROIs (*A* and *B*), separately for each condition (columns). Light colors, same motor act; dark colors, different motor act. Time window for averaging is marked in gray. Error bars indicate SEM. TR = 0 indicates trial onset. EBA L., left extrastriate body area; EBA R., right extrastriate body area.

Table S1. Pairwise comparisons computed within predefined ROIs (visuomotor ROIs: conjunction hand execution, foot execution \cap hand observation, foot observation; motor ROIs, conjunction hand execution > scrambled observation \cap foot execution > scrambled observation; visual ROIs, conjunction hand observation, foot observation > scrambled observation)

Table S2. Overview of Talairach coordinates for left and right inferior parietal lobule from studies on observation, imagery, and execution of motor acts

Paradigm	Talairach coordinates					
	IPL, left hemisphere			IPL, right hemisphere		
	x	y	z	x	y	z
Buccino et al. (1)	Observation	-60	-40	36	52	-32
Filimon, Nelson, Hagler, and Sereno (2)	Imagery	-58	-34	39	51	-33
Buccino et al. (3)	Execution	-57	-18	18	51	-29
Chong, Cunnington, Williams, Kanwisher, and Mattingley (4)	Observation			57	-53	34
Mean		-58	-31	31	53	-37
						40

Coordinates reported in MNI space (2, 4) were converted into Talairach coordinates using the matlab function mni2tal (available under <http://imaging.mrc-cbu.cam.ac.uk/imaging/MniTalairach#head-b3a445e55dd349a8b2349accea51ab298c90685b>). The two ROIs were defined using $10 \times 10 \times 10 \text{ mm}^3$ around the mean Talairach coordinates.
