

Supplementary 1

Inhibition of Ca²⁺ current amplitude by DAMGO (1 μ M) applied alone or in combination with DPDPE (1 μ M) or deltorphin II (DELTII, 1 μ M). The data are averages of recordings from six δ +/ δ DRG neurons that received all three treatments. The order of drug application was randomized to avoid a systematic impact of desensitization due to multiple applications of DAMGO. Vertical bars represent \pm SEM.
