Supporting Information Figure 1

Constructed pET-LinkCD plasmid for the expression of the LinkCD fusion protein. The insert size is 885 bp. 1) Double digestion of pET-LinkCD with NdeI and BamHI restriction enzymes. 2) double digestion of empty plasmid, 3) uncut pET-LinkCD, 4) uncut pET15, 5) PCR amplified LinkCD fragment.

B

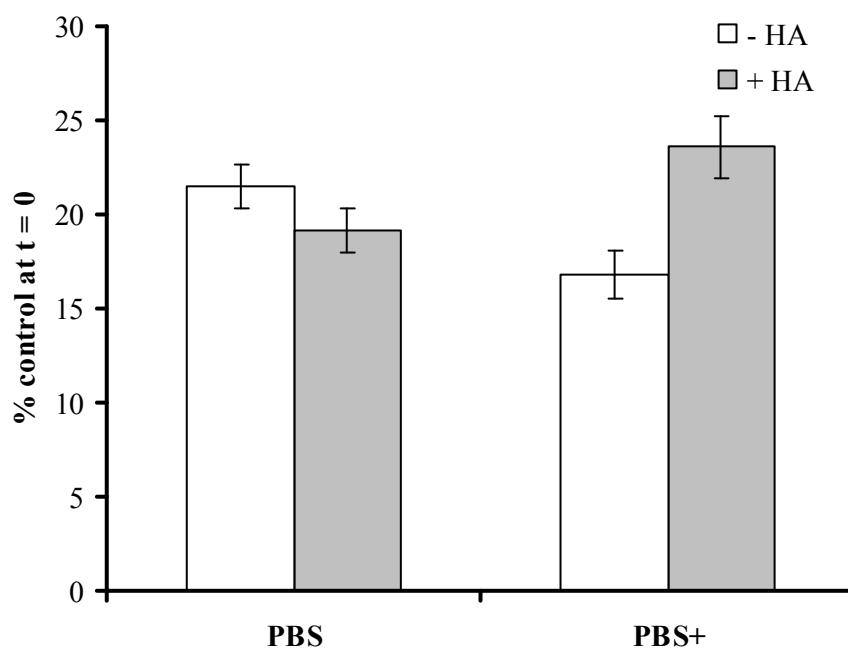

C

Link-mtCD: a functional mutant that lacks the enzyme activity. A. A sequence alignment between the pET-Link-mtCD (mutant) and pET-LinkCD (reference) showing the point mutation of A to C, indicated by the arrow. B. Enzyme assay shows that Link-mtCD does not convert 5-FC to 5-FU. C) SDS-PAGE gel showing purified LinkCD (lane 1) and Link-mtCD (lane 2).

Supporting Information Figure 3

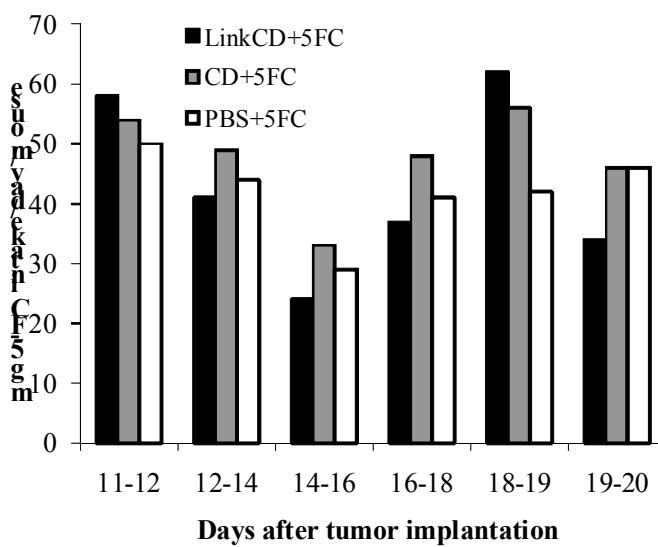

Cytosine deaminase activity of the LinkCD fusion protein after 24 hr incubation at 37°C in PBS.

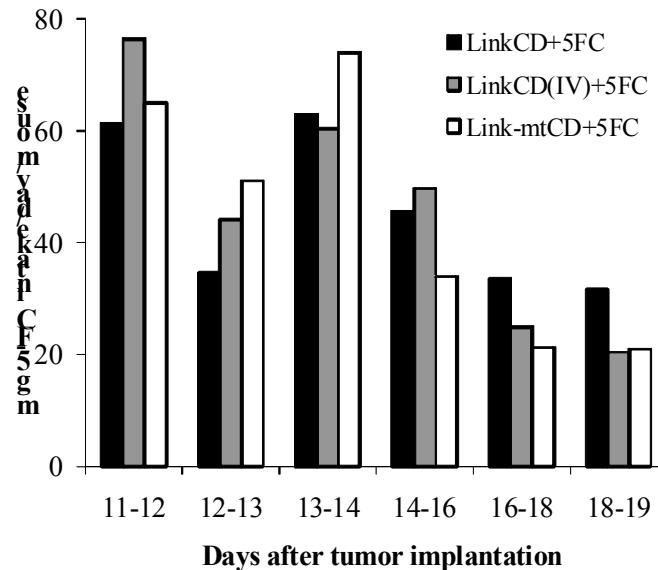

Enzyme activity of LinkCD in the presence of 0.1 mg/ml hyaluronan (HA). PBS+ contained Ca^{2+} and Mg^{2+} whereas PBS did not contain these divalent cations.

51 **5-FC consumption by animals in therapeutic experiments.** The amount of 5-FC consumption was
52 estimated by weighing water bottles containing 5-FC (10mg/mL). **A.** Anti-tumor experiment with
53 LinkCD + 5FC, CD + 5FC, and PBS + 5FC groups. **B.** Second experiment with LinkCD + 5FC, LinkCD
54 (IV) + 5FC, and Link-mtCD + 5FC groups.

5-FC consumption by individual animal that received LinkCD treatment. Each animal was housed separately and the daily intake of 5-FC by individual animal was monitored. The survival of animals showed similar results as shown in Figure 4 and 5.

Supporting Information Table 1: Summary of SPR binding kinetics data

pH	k_a ($M^{-1}s^{-1}$)	k_d (s^{-1})	K_D (M)	χ^2
6.0	246.06	0.0013	5.32E-6	0.168
7.4	49.35	0.0027	5.50E-5	0.705

Summary of the binding kinetics between LinkCD and 12-mer hyaluronan measured by SPR. The χ^2 value represents the sum of squared deviation of the binding model from the experiment data. The model fits well for the interaction between LinkCD and hyaluronan at pH 7.4.
