Supplementary File 3 - Box plots of d_N, d_S, and d_N/d_S distributions for genes classified into gonadal or non-gonadal categories in the embryonic and adult stages based on EST data. Distributions are shown for each specificity threshold: (from left to right, in increasing contrast) No specificity threshold, greater than 2-fold, 4-fold, or 8-fold proportion of representation relative to other stages/tissues, and unique to a single developmental stage/tissue. Box plots were produced both by combining the adult gonads (A, B, C) as well as by separating ovary and testis into distinct categories (D, E, F) (see Methods).
