

Appendix One. The hierarchical level of each concept, its coverage in the pre-workshop version of the course (1=covered; 0=not covered), its coverage in the Spring 2008 version of the workshop course (1=covered; 0=not covered), and a description of each concept is listed in this appendix.

Level	Pre	Post	Concept
1 st	1	1	Scientific knowledge is based on the evaluation of tentative hypotheses through systematic observation of nature.
2 nd	1	1	Hypotheses are claims which can be scientifically tested, and potentially disproved.
3 rd	1	1	Exploration of initial observations and related knowledge contributes to <i>hypothesis generation</i> .
3 rd	1	1	<i>Hypotheses-testing</i> includes using the hypothesis to generate a prediction, then making observations and comparing the prediction of the hypothesis to the observations.
3 rd	1	1	Hypotheses can be tested with <i>controlled experiments</i> which have independent and dependent variables or through <i>natural experiments</i> which do not include the controlled manipulation of independent variables.
3 rd	1	1	Quantitative patterns in observed results are often illustrated with <i>graphs</i> .
4 th	1	1	All experiments make <i>assumptions</i> which may or may not be true.
4 th	1	1	<i>Null hypotheses</i> can be disproved but not proved.
4 th	1	1	<i>Inferential statistics</i> estimate the probability that the variation between the observations and prediction are simply due to chance.
4 th	1	1	<i>Model systems</i> are often used in controlled experiments.
4 th	0	1	Some hypotheses are represented with <i>mathematical models</i> .
2 nd	1	1	The level of acceptance of hypotheses varies greatly as a result of the number and quality of tests of the hypothesis that have supported it.
2 nd	1	1	Scientific facts are observations or hypotheses that have been supported so many times that they are assumed to be true.
3 rd	1	1	Examples of scientific facts: cells exist; genes are coded into the structure of DNA; evolution happens.
2 nd	1	1	Theories are major concepts which link together many observations and hypotheses.
1 st	1	1	Evolution is the change in the frequency of heritable traits of a population across generations.
2 nd			Natural selection can result in adaptive evolution.
3 rd	1	1	Natural selection is <i>differential survival</i> of individuals within a population based on a variation in trait.
4 th	1	1	Natural selection is an interaction between individuals and their environment.
3 rd	1	1	Natural selection results in evolution if the selected trait is <i>heritable</i> .
3 rd	1	1	<i>Populations not individuals</i> evolve.
3 rd	1	1	Evolution cannot occur unless there is <i>heritable variation</i> for the trait in the population.
4 th	1	0	Natural selection can result in <i>directional, stabilizing, or disruptive</i>

			changes in phenotypes.
4 th	1	1	Natural selection <i>against a dominant allele</i> can result in rapid fixation of the recessive.
4 th	1	1	Natural selection <i>against a recessive allele</i> does not result in fixation.
4 th	1	1	Natural selection <i>favoring heterozygous</i> genotypes maintains a balance of the frequency of alleles in the population and maintains genetic diversity.
2 nd	1	1	Genetic Drift is a random pattern of evolution due to bottlenecks and founder effects.
3 rd	1	1	<i>Genetic drift</i> is due to random sampling error of a trait in association with mortality or dispersal.
3 rd	1	1	<i>Genetic (or demographic) Bottlenecks</i> are random mortality relative to a trait.
3 rd	1	1	<i>Founder effects</i> are random dispersal relative to a trait.
3 rd	1	1	Genetic drift reduces <i>genetic diversity</i> .
3 rd	1	1	Reduced genetic diversity can result in <i>inbreeding depression</i> .
4 th	1	1	Genetic drift and inbreeding depression are problems for <i>endangered species</i> .
2 nd	1	1	Sexual selection is due to differences in fitness due to variation in traits which influence mating success.
3 rd	1	1	<i>Sexually dimorphic</i> traits are more pronounced in the sex which invests less energy in producing gametes and caring for offspring (typically males).
4 th	1	1	Sexually dimorphic traits function as <i>armaments</i> and/or <i>ornaments</i> .
3 rd	1	1	Mate choice can be influenced by pre-existing sensory bias, non-genetic benefits to offspring or female, genetic benefits to offspring.
2 nd	1	1	Speciation occurs when gene flow between diverging populations is blocked.
3 rd	1	1	<i>Microevolutionary processes</i> (natural selection, genetic drift, mutation, gene flow) contribute to speciation.
4 th	1	1	Secondary contact <i>reinforces</i> speciation if hybrids are less fit.
3 rd	1	1	Speciation can occur <i>rapidly or slowly</i> .
3 rd	1	1	<i>Adaptive Radiations</i> are characterized by relatively rapid speciation and diversification within a taxa.
4 th	1	1	Adaptive radiations are triggered by <i>opportunities</i> resulting from environmental or genetic change.
4 th	1	1	Heritable variation associated with adaptive radiations is often associated with <i>regulatory genes</i> .
2 nd	1	1	Extinction is the permanent loss of a species.
3 rd	1	1	Mass extinctions are times of widespread and relatively rapid extinction rates.
4 th	1	1	The <i>K-T mass extinction</i> resulted in reduced dominance of reptiles and gymnosperms and triggered the adaptive radiations of angiosperms, insects, birds, and mammals.
4 th	1	1	The K-T mass extinction was due to an <i>asteroid</i> impact.
4 th	0	0	Some mass extinctions may have been influenced by the effects of the arrangement of <i>continental plates on climate</i> .
4 th	0	0	We are entering a mass extinction due to climate change, habitat

			destruction, and invasive species.
1 st	1	1	Biodiversity is a result of historic patterns of speciation and extinction
2 nd	1	1	Phylogenies are hypotheses about speciation and extinction within a taxa.
3 rd	1	1	<i>Domains</i> indicate that 2/3 of the diversity of life is prokaryotic.
4 th	1	1	The wide range of habitats colonized by <i>prokaryotes</i> is associated with their <i>diverse metabolism</i> .
3 rd	1	1	The phylogenetic history of <i>plants</i> is associated with adaptation to terrestrial environments.
4 th	1	0	The fundamental life history difference between plants and animals is mitotic growth during the haploid stage of plant life cycles to produce <i>gametophytes</i> .
3 rd	1	1	<i>Fungi</i> are more closely related to <i>animals</i> than to plants.
4 th	1	0	Fungi differ from animals in that they secrete enzymes, <i>externally digest</i> molecules including cellulose, and then absorb the nutrients.
3 rd	1	1	<i>Animal Phyla</i> are associated with morphological, mobility, & perceptual adaptations
4 th	1	1	Exo- and endo-skeletons enable precise muscle control of appendages
4 th	1	1	Insect pollinators & herbivores co-evolved with angiosperms
1 st	1	1	Phenotypes are determined by genotypes and the environment .
2 nd	1	1	Genes are discrete units on information passed unchanged, except for rare mutations, from parents to offspring.
2 nd	1	1	The genetic code is a result of the structure of DNA within chromosomes.
2 nd	1	1	Alleles are versions of genes.
3 rd	1	1	Mutation produces new alleles.
4 th	1	1	Mutations can occur at many levels: point mutations, chromosomal rearrangements, and changes in ploidy.
2 nd	1	1	Genotypes describe an individual's alleles.
2 nd	1	1	Phenotypes describe observable traits of individuals.
2 nd	1	1	Meiosis, fertilization, and gene expression underlie Mendelian patterns of inheritance .
3 rd	1	1	Somatic cells are <i>diploid</i> .
3 rd	1	1	<i>Meiosis</i> randomly separates homologs into haploid gametes.
3 rd	1	1	Genes on nonhomologous chromosomes <i>sort independently</i> resulting in genetic variation among gametes.
3 rd	1	1	<i>Crossing over</i> increases genetic variation by rearranging alleles of genes between homologs.
3 rd	1	1	<i>Fertilization</i> combines haploid gamete genotypes into diploid zygotes.
3 rd	1	1	<i>Dominance relationships</i> describe the phenotypic expression of heterozygotes.
4 th	1	1	<i>Pleiotropic</i> genes influence more than one phenotypic trait.
4 th	1	1	<i>Epistatic</i> interactions between gene products influence the expression of genotypes into phenotypes.
3 rd	1	1	<i>Quantitative traits</i> are influenced by polygenic genes.
3 rd	1	1	In humans, X-linked genes are hemizygous in males.
4 th	1	1	Males inherit these genes from their mothers.

4 th	1	1	Multiplicative probability describes the increased expression of recessive X-linked genes in males.
2 nd	1	1	While mutation is the ultimate source of new alleles, recombination produces new combinations of alleles.
3 rd	1	1	In <i>eukaryotes</i> , crossing over, independent assortment, and fertilization contribute to recombination.
3 rd	1	1	In <i>prokaryotes</i> , horizontal gene transfer results in recombination.
1 st	1	0	Behavioral traits evolve in response to natural selection .
2 nd	1	0	Behavior is a response to a stimulus .
2 nd	1	0	Behaviors range from innate fixed action patterns to complex learned behaviors.
2 nd	1	0	Behaviors can be learned through a variety of processes (e.g. operant, habituation, classical conditioning, imprinting).
1 st	1	1	Populations have dynamic spatial and temporal structures.
2 nd	1	1	Population's characteristics are estimated with a variety of sampling techniques.
2 nd	1	0	The spatial boundaries of populations are influenced by abiotic factors, as well as species interactions; both of these factors change through time.
3 rd	1	1	<i>Invasive species</i> have moved out of their native region and are disturbing natural and human communities.
2 nd	1	1	Population size and density varies through time.
3 rd	1	1	Populations with a constant and positive per capita growth rate grow exponentially .
4 th	1	1	All species have a positive <i>biotic potential</i> .
4 th	1	1	<i>Birth rate, death rate, and migration</i> determine <i>r</i> .
4 th	1	1	Birth rate is determined by <i>fecundity and age structure</i> .
4 th	1	1	Death rate is determined by <i>life span and age structure</i> .
4 th	1	1	Age structure causes <i>demographic momentum</i> .
3 rd	1	1	<i>Density-dependent mortality</i> can regulate <i>N</i> at <i>K</i> .
3 rd	1	1	The <i>global human metapopulation</i> has increased global <i>K</i> , reduced <i>d</i> through agricultural, medicinal, and scientific innovations, and reduced <i>b</i> through birth control but is still growing exponentially.
1 st	1	1	Species interactions influence the evolution of traits, population growth, and community structure.
2 nd	1	1	Parasitism, predation, and herbivory are + -.
2 nd	1	1	Competition is - -.
3 rd	1	1	<i>Intraspecific competition</i> results in density-dependent mortality and contributes to <i>K</i> .
3 rd	1	1	Strong intraspecific competition can contribute to <i>coexistence</i> .
3 rd	1	1	Interspecific competition can result in <i>competitive exclusion, niche differentiation, and habitat partitioning</i> .
3 rd	1	1	Inter- and intra-specific competition can occur through <i>exploitation or interference</i> .
3 rd	1	1	<i>keystone predators</i> can reduce interspecific competition and increase species diversity of prey species.
2 nd	1	1	Mutualism is + +.
3 rd	1	1	Mutualism can promote <i>coexistence</i> and expand niches.
1 st	1	1	Communities change in response to biotic and abiotic factors.
2 nd	1	1	<i>Primary succession</i> initially favors species with high dispersal and

			tolerance.
2 nd	1	1	<i>Secondary succession</i> is promoted by facilitation; slowed by inhibition.
3 rd	1	1	<i>Intermediate disturbance</i> can increase species diversity and productivity
2 nd	1	1	<i>Species diversity</i> increases with decreasing <i>latitude</i> .
1 st	1	1	Energy flows through ecosystems ; nutrients cycle within ecosystems.
2 nd	1	1	Atmospheric nitrogen is common, but nitrogen is often <i>limiting</i> .
3 rd	1	1	Nitrogen fixation, nitrification, and denitrification depend on <i>bacteria</i> .
2 nd	1	1	Photosynthesis & cellular respiration are important components of energy flow and carbon cycling.
3 rd	1	1	Deforestation and burning fossil fuels influence carbon cycling, energy flow, and result in climate change.
4 th	1	1	There are direct and indirect measures of increasing atmospheric carbon dioxide.
4 th	1	1	There is theoretical and empirical evidence of the link between carbon dioxide and climate change.
4 th	1	1	Climate change, along with invasive species and habitat destruction, is resulting in the disruption of natural communities.
