

Treating entropy and conformational changes in implicit solvent simulations of small molecules: Supporting Information

David L. Mobley, John D. Chodera and Ken A. Dill

Draft date August 9, 2007

TABLE 1: The small molecule test set used here, with names and experimental hydration free energy values (in kcal/mol), as well as references to the source of the experimental values. Numbering up to 600 corresponds to the numbering used in the Rizzo test set¹ and is not necessarily consecutive. Numbering after 600 is unique to this set, which contains only neutral molecules. Values are transfer free energies from 1M gas to 1M in solvent. In the column with names of compounds, spaces have been replaced by underscores, following the formatting of Rizzo *et al.*

Number	Name	Hydration free energy	Reference
1	methane	1.99	1
2	ethane	1.83	1
3	propane	1.96	1
4	n-butane	2.07	1
5	2-methylpropane	2.32	1
6	n-pentane	2.32	1
7	2-methylbutane	2.38	1
8	2,2-dimethylpropane	2.51	1
9	n-hexane	2.48	1
10	2-methylpentane	2.51	1
11	3-methylpentane	2.51	1
12	2,2-dimethylbutane	2.51	1
13	2,3-dimethylbutane	2.34	1

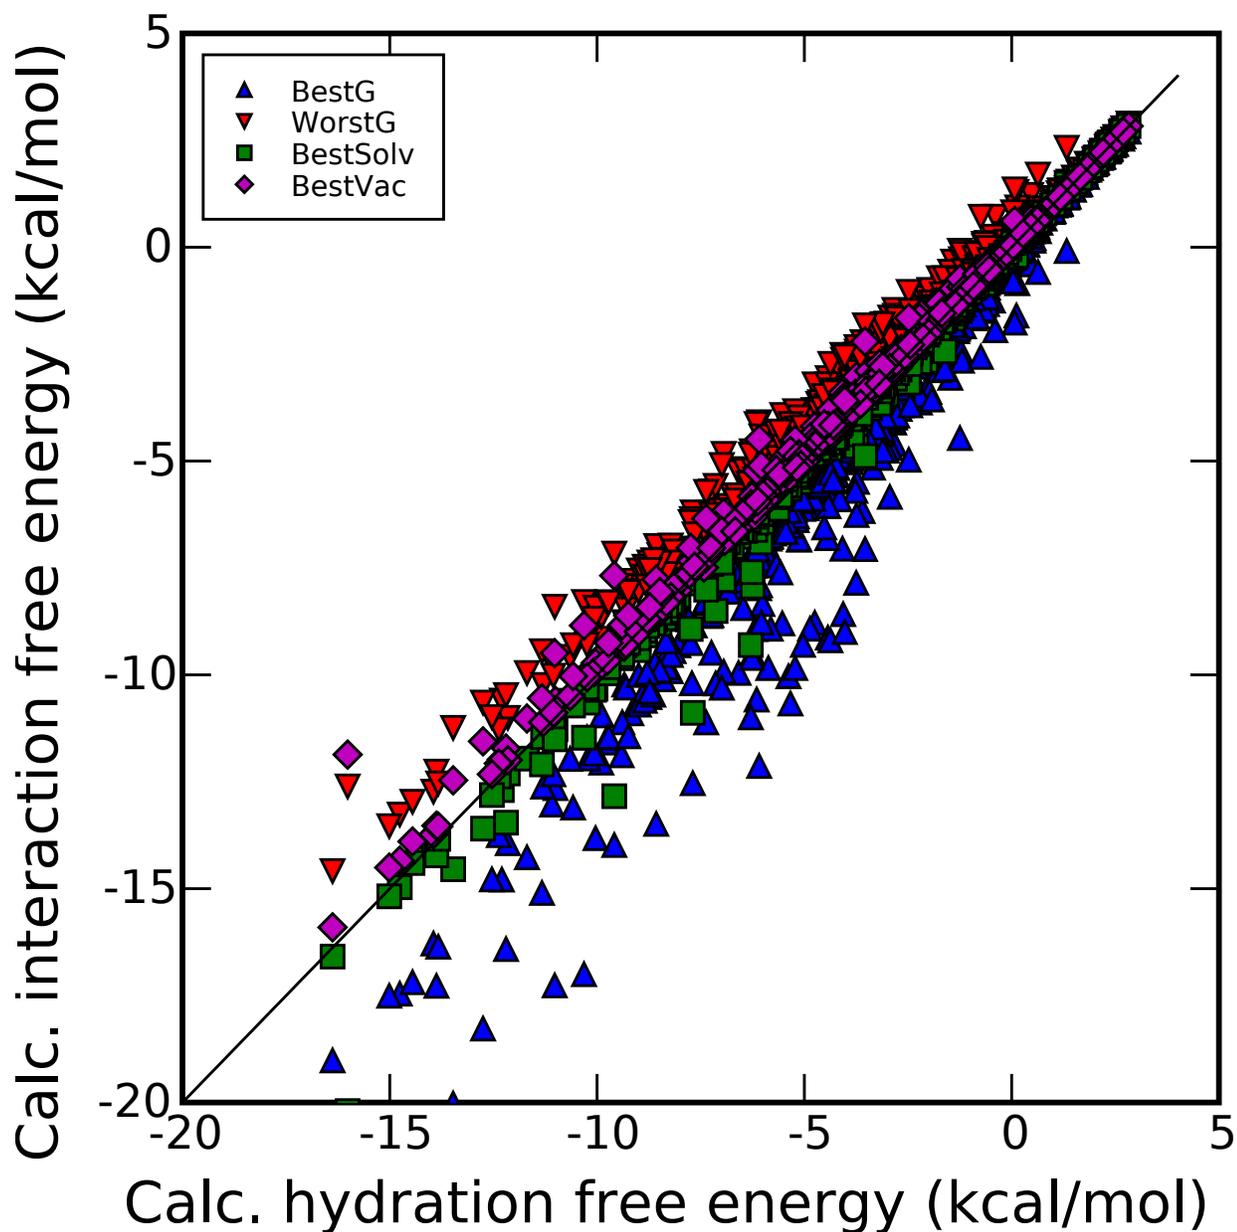

Figure 2. Calculated hydration free energies versus interaction free energies computed with different conformations. Calculated hydration free energies are plotted, versus single-conformation interaction free energies computed using the different schemes for selecting conformations: BestG, the conformation resulting in the most favorable interaction free energy; WorstG, the conformation resulting in the least favorable interaction free energy; BestVac, the conformation with the lowest potential energy in vacuum; BestSolv, the conformation with the lowest potential energy in solvent. The diagonal line is the $x = y$ line, and indicates exact agreement between calculated interaction free energies and calculated hydration free energies.
