Supplemental Table 2. Antibodies used in the study

Antibody specificity	Clone	Source	Working dilution
CD11c	KB90	Dako	1:200
CD86	BU63	Dako	1:200
von Willebrand Factor		Dako	1:1000
TLR2	TL2.1	Biolegend	1:50
TLR4	HTA125	Imgenex	1:50
TLR5	19D759.2	Imgenex	1:50
Goat anti-mouse secondary	Polyclonal	Dako	1:400
Sheep anti-rabbit secondary	Polyclonal	Abcam	1:400

Type of file: table

Label: 3

Filename: Supplemental_Table_3.doc

Supplemental Table 3. DC positioning in different vascular beds.

Artery	Intima	Media	Adventitia
Aorta	++	rare	++
Carotid artery	++	rare	+
Iliac artery	rare	rare	+
Subclavian artery	rare	rare	+
Mesenteric artery	rare	rare	+
Temporal artery	absent	rare	+

Supplemental Table 3. CD11c⁺ vascular DC were identified as described in Fig. 1 in 7 different aortas, 7 carotid arteries, 5 iliac arteries, 7 subclavian arteries, 6 mesenteric arteries, and 5 temporal arteries. Cell counts were determined in circumferential sections throughout the intima, media, and adventitia of each vessel. ++ indicates 4-5 cells/hpf; + indicates 2-3 cells/hpf.

Type of file: table

Label: 4

Filename: Supplemental_Table_4.doc

Supplemental Table 4. Responsiveness of venous and arterial tissues to TLR4 ligands.

	DC activation marker	Control (copy numbers)	LPS (copy numbers)
Vein	CD83	18±6	25±12
	CD86	≤2	≤2
Artery	CD83	253±5	692±93
	CD86	24±2	120±5

Supplemental Table 4. Venous and arterial semi-rings were stimulated with LPS or left untreated for 24 hours in organ culture as described. Total RNA was isolated from shock frozen tissues. The table shows the gene expression of DC activation markers CD83 and CD86 adjusted to β -actin. Numbers presented are averages of duplicate measurements ± standard deviation.
