

Supplemental Fig. S1

Supplemental Fig. S1. Localization of Necl-2 mutants. FLAG-tagged Necl-2, Necl-2- Δ CP, or Necl-2- Δ EC was transiently expressed in A549 cells. As a control, an empty vector was transfected in A549 cells. The cells were fixed using 4% paraformaldehyde/PBS without permeabilization, and then were stained with the anti-FLAG mAb. The samples were analyzed by confocal laser-scanning microscopy. *DIC*, a differential interference contrast image; *scale bars*, 10 μ m. The results shown are representative of three independent experiments.
