Experiment Procedures

^1H Nuclear magnetic resonance (^1H NMR)

The ^1H NMR spectra of the synthesized poly(disulfide amine)s in D_2O were recorded at 400 MHz.

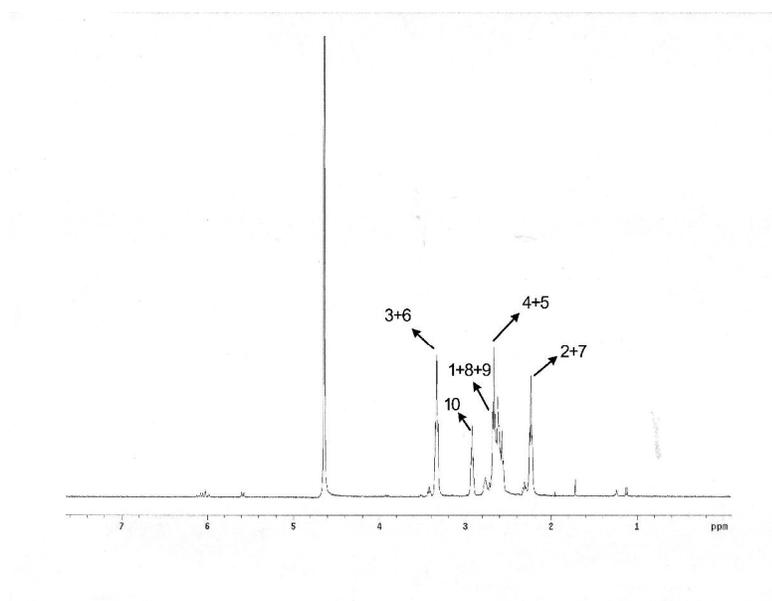

Fast protein liquid chromatography (FPLC)

FPLC measurements were performed using an AKTA FPLC system with a Superose 12 column, and ultraviolet and refractive index detectors. Polymers were loaded into the column as a concentration of 25 mg/mL and eluted with Tris buffer (pH 7.4), which were calibrated using a poly[*N*-(2-hydroxypropyl)-methacrylamide] (pHPMA) standards.
