Supplementary information Scheme 1: Other examined reagents.

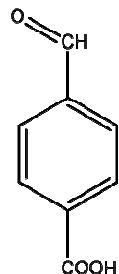

(a)

2-formyl-benzenesulfonic acid

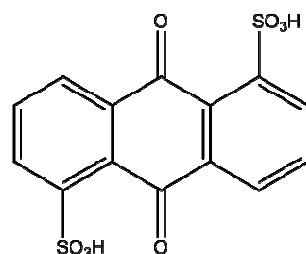

(b)

2-formyl-benzoic acid

(c)

4-formyl-benzoic acid

(d)

Anthraquinone-1,5-disulfonic acid

Deprotonated forms of the reagents a)-d) were also examined with triply protonated RGAGGKGAGGRL. Deprotonated a) showed evidence for Schiff base formation but a lesser degree of adduct formation than deprotonated 4-formyl-1,3-benzenedisulfonic acid. Deprotonated forms of reagents b)-d) showed exclusive proton transfer.

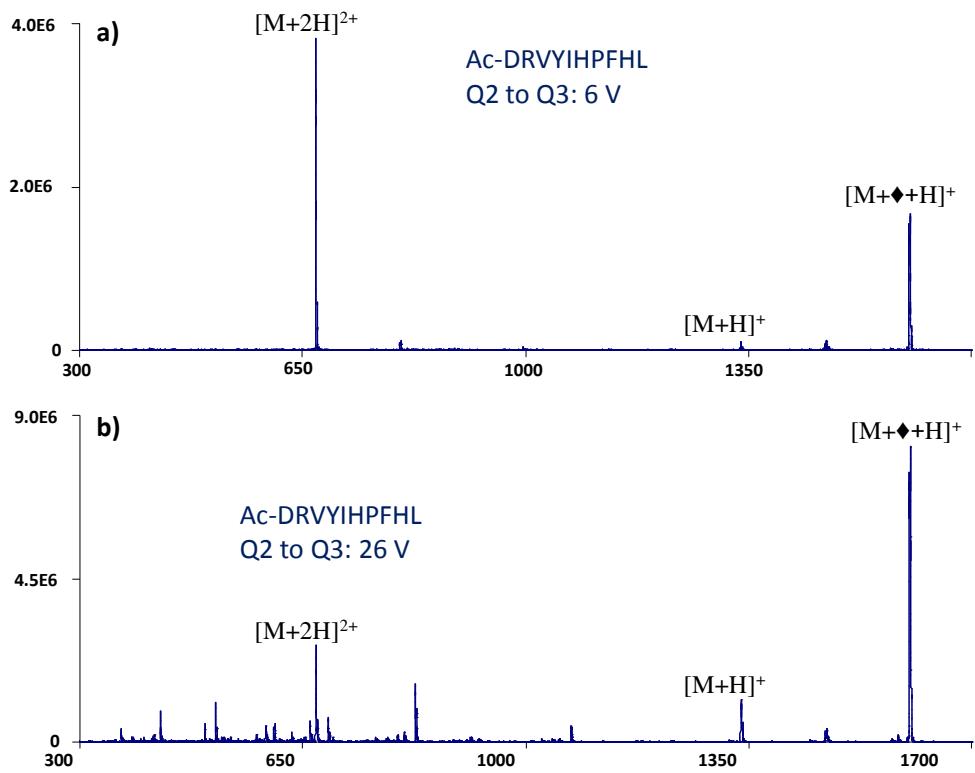

Figure S1 – a) Post-ion/ion reaction spectrum following reaction of deprotonated 4-formyl-1,3-benzenedisulfonic acid with doubly protonated N-terminally acetylated angiotensin and transfer to the analyzer quadrupole with a voltage difference of 6 V. b) Same as in a) except the transfer voltage was 26 V.

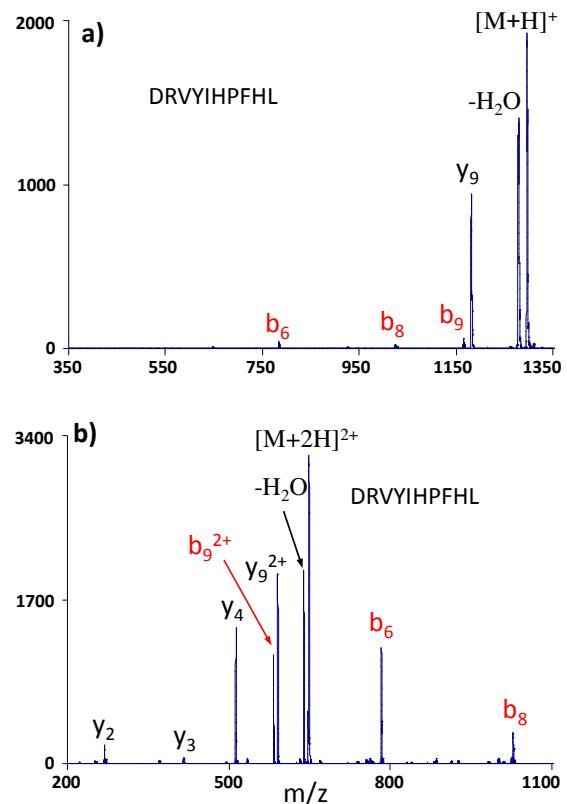

Figure S2 – Ion trap CID product ion spectra of a) singly- and b) doubly-protonated angiotensin I.
