Sampling of colon specimens

After CO₂ asphyxiation of each mouse the entire colon was quickly removed, placed into ice-cold PBS and 1 cm colonic specimens were taken just distal to the cecum (proximal colon) and above the rectum (distal colon). The remaining colon was cut in half longitudinally. One half was snap frozen and stored in liquid nitrogen (LN2) for and the other half immersed in RNA later™ (Ambion), kept at 4C° for 24h and stored in LN2 for RNA isolation. Proximal and distal colon specimens were embedded in Optimal Cutting Temperature medium, frozen in LN2 pre-cooled isopentane, and stored at -80°C until cryosectioning. Eight µm sections were cut onto Poly-L-lysine coated superfrost/plus slides for F4/80 immunostaining.

Analyses and functional interpretation of microarray data

Functional network and pathway analyses -Networks, canonical pathways and functional analyses were generated through the use of Ingenuity Pathways Analysis (IPA) (Ingenuity® Systems) (1). IPA Knowledge Base comprises manually curated molecular interactions. Three and 6 mo differentially expressed data sets (*P*-value < 0.05, no FDR applied) were used for the analysis. Each gene identifier was mapped to its corresponding gene object in the Ingenuity Pathway Knowledge Base. These so called “focus genes” were then used as a starting point for generating networks and identifying pathways or biological functions. The functional analysis and canonical pathways analyses identified biological functions and pathways that were most significant to the data set. Fischer’s exact test was used to calculate p-values determining the probability that the association between the genes in the dataset and either canonical pathway or biological function could be explained by chance alone. Significances for biological functions or canonical pathways were assigned to each network by determining a *P*-value for the enrichment of the genes in the network for such functions or pathways compared with the whole Ingenuity pathway knowledge base as a reference set. A score of greater than 2 indicates that there is a less than 1 in 100 chance that the Focus Genes were assembled into a network due to random chance alone.

Gene Ontology- EASE program (NIH, NIAID) (2) was used to determine which Gene Ontology (GO) categories were statistically over-represented among differentially expressed genes. The enrichment *P*-values were calculated using modified Fisher’s exact test with Bonferroni adjustment for multiple testing. *P*-values < 0.05 were considered significant. 3 and 6 month differentially expressed gene sets (*P*-values < 0.05, no FDR applied) were used for the analysis

Gene Set Enrichment Analysis (GSEA) was used to identify statistically significant coordinated changes in a defined gene set between the WD and control groups at 3 and 6 mo. A custom gene set was generated based on thoroughly researched panels of oxidative stress related genes (Superarray Bioscience, Mouse Pathway Focused PCR Array Lists). GSEA analysis was performed using a desktop application available at Broad Institute (3). Normalized expression values for the whole microarray gene set were extracted from GeneSifter and the data were converted from probe sets to gene symbols.

Online Supporting Material

The input gene set was comprised of C2 pathway and a manually curated literature collection of the Molecular Signature Database Version 1 (MSigDB)(4). *P*-values were calculated by permuting genes 1000 times. Permutation type was set to ‘gene set’. False positive rate was controlled by the proportion of false positives by calculating the false discovery rate (FDR) corresponding to each normalized enrichment score (NES). The FDR was computed by comparing the tails of the observed and null distributions for the NES. Gene sets with FDR < 0.25 and nominal *P*-values < 0.05 were considered significant.

Validation of Microarray data by qPCR

Quantitative RT-PCR (qPCR) was used to verify the microarray results. The same batch of total RNA samples used for microarray analysis from 4 control and 4 experimental mice at both time points were reverse transcribed with random nonamers using Eurogentec (San Diego, CA) RT core kit (RT-RTCK-05) to yield first-strand cDNA. 11 Taqman Gene Expression Assays (ABI, Applied Biosystems; Supplemental Table 3) were designed across exon boundaries to avoid genomic DNA detection. Each assay contains pre-formed primers and Taqman probe in a 20X concentration. Taqman assay reactions were performed in 384-well optical plate and run in the ABI 7900HT Sequence Detection System. Efficiency of all assays was equal as determined from ΔCt vs. log input in validation experiment; therefore the comparative $\Delta\Delta Ct$ method was used for quantification. All amplification were done in triplicate and real-time thermal profile was set as 50°C/2min, 95°C/10min and 40 cycles of 95°C/15sec; 60°C/1min. The threshold cycle (Ct) scores were averaged for subsequent calculations of relative expression values by using Applied Biosystems Sequence Detection System 2.3 (SDS) software. The Ct scores represent the cycle number at which fluorescence signal crosses the threshold value. The Ct scores for genes of interest for each sample were normalized against Ct scores for the corresponding endogenous control gene, which was GAPDH. The comparative Ct method was used to calculate relative expression between the WD group and controls, the formula is expressed as: relative expression = $2^{-\Delta\Delta Ct}$.

2 = The fold change between Ct values (doubling of PCR amplicon).

$\Delta\Delta Ct$ = (Ct experiment – Ct GAPDH) – (Ct control – Ct GAPDH).

This equation means how many doublings or fold changes of amplicon occur between cycles of your control (calibrator) vs. experiment samples.

Digital image acquisition for computerized histomorphometry analysis

Digital images of microscopic fields of cross sections (x20 objective and x10 ocular lenses) were acquired with a Zeiss Axioplan2 microscope equipped with QImaging Retiga Camera system and integrated LCD filter. Camera settings were at maximal sensitivity and 1/400 sec exposure time. White balancing was performed before image acquisition. Digital images were saved in 24-bit color TIFF format. For each mouse, 5-7 images of the colonic cross section were taken to represent the entire section.

Pro- and anti-inflammatory protein expression profiling

Clarified tissue extracts of mid colon from 10 mice/group, 40 samples in total, were analyzed by a Rodent Multi-Analyte Profile testing (Rules-Based Medicine, Rodent MAP version 1.6 antigen panel;) (5), a high-density, quantitative immunoassay of pro-and anti-inflammatory protein expression in small samples. Tissues were homogenized in 9

Online Supporting Material

volumes of lysis buffer (weight/volume; 0.05 mol/L Tris-HCL with 2 mmol/L EDTA, pH 7.4) containing protease and phosphatase inhibitor cocktails (P 8340 and P 5726, Sigma, MI, U.S.A) and centrifuged for 2 min at 13, 000xg. Supernatant fractions were collected and frozen at -80°C until analysis by the Rodent MAP testing. The Least Detectable Dose (LDD) for each analyte is defined as the mean background value for 20 determinations plus three standard deviations. Values above the LDD possess excellent precision with coefficients of variation (CV) usually below 10%. The Lower Assay Limit (LAL) is defined as each assay's working sensitivity in plasma as defined by the lowest concentration calibrator used for quantitation. Values between the LDD and LAL are less precise and were set to the LAL for data mining. Two-tailed student's *t*-test was used to compare diet-dependent protein expression levels and values of P<0.05 were considered to be statistically significant.

Quantitative analysis of redox active compounds in colon tissues

The concentrations of selected redox active compounds were measured using a Perkin-Elmer HPLC equipped with an 8 channel coulometric array detector (ESA) (6). Frozen colonic segments from 6 animals fed the WD or the control diet for 6 mo were homogenized in 5 volumes of cold PBS (weight/volume) and a 50 µL aliquot was mixed with 15 µL of 25% solution of metaphosphoric acid. Samples were allowed to stand for 15 minutes at 4 °C and were centrifuged at 10,000-x g for 10 minutes to sediment protein. Cell pellet precipitates were dissolved in 0.1 mol/L NaOH and saved for protein determinations by a spectrophotometric quantitation method using BCA reagent (Pierce Chemical). The concentrations of redox sensitive compounds in the supernatant fractions were determined by injecting 5 µL aliquots onto an Ultrasphere 5 u, 4.6 x 250 mm, C18 column and eluting with a mobile phase of 50 mmol/L NaH₂PO₄, 0.05 mmol/L octane sulfonic acid, 2% acetonitrile (pH 2.62) at a flow rate of 1 mL/min. The 8-channel CoulArray detectors were set at 200, 350, 400, 450, 500, 550, 600 and 700 mV, respectively. Peak areas were analyzed using ESA, Inc. software. The concentrations of redox active compounds in the samples were compared against standards for each derivative (cysteine, cystine, ascorbate, methionine, glutathione, oxidized glutathione, and uric acid) and were reported as nmol/mg protein. The range of concentrations of each standard curve was 10 to 200 pmol/L.

¹Ingenuity canonical pathway analyses of 3 mo and 6 mo differentially expressed total data sets (P -value < 0.05 , no FDR applied). ²Fischer's exact test was used to calculate P -values.* Different from control, $P < 0.05$; ** $P < 0.01$, *** $P < 0.001$.³The ratio is calculated as the number of differentially expressed genes divided by the total number of genes that make up that pathway.

C. Upregulated genes at 3 months

ARG2, C10ORF119, CRY2, Cyclin A, DBP, E2f, EIF2S2, Glutathione transferase, GST, GSTA2, GSTA4, GSTA5, GSTM2, GSTM3 (includes EG:14864), GSTO1, GSTP1, Histone h3, HMGCR, HMGCS1, HMOX1, KCNQ1, LIG1, MCM4, MCM5, MCM6, MT1E, MT2A, MTF1, NDRG1, PDGF BB, PER2, PER3, Pka, Pkc(s), UHRF1	42	21	Amino Acid Metabolism, Cellular Compromise, Vitamin and Mineral Metabolism
--	----	----	--

Online Supporting Material

AACS, CFD, cholic acid, CYP2E1, CYP7A1, DHCR7, FA2H, FABP4, FABP6, fatty acid, FDPS, FGF19 (includes EG:9965), GH1, ID3, IDH1, IGK, INSIG1, LDLR, LSS, malonyl-coenzyme A, mevalonic acid, MVD, NSDHL, PCSK9, PPARGC1B, RETN, RORC, SC4MOL, SLC7A9, SQLE, SREBF1, SREBF2, sterol, TCF3, UCP2	29	16	Lipid Metabolism, Small Molecule Biochemistry, Molecular Transport
APOC3, ATP6V1B1, beta-estradiol, CBX5, CCDC85B, CDKN1A, CHAF1B, CLCN3, CTSB, CYP2D10, CYP2D26, CYP2E1, CYP4B1, CYP4F12, ELOVL6, EPB41L3, FGFBP1, HKDC1, HSD17B7, INS1, MCM3, MCM6, MT1E, NCOA5, NCOR1, NR1D1, NR1D2, OPRK1, ORC1L, PRLR, PRMT5, RETSAT, SLC9A3R1, SMARCA4, Unspecific monooxygenase	29	16	Cell Morphology, Cellular Development, Connective Tissue Development and Function
ACAA2, ADIPOR2, ADRB3, ALDH1A7, ALDH1B1, BIRC3, CA1 (includes EG:759), CBR3, CHST4, CTSD, CXCL13, CYP17A1, ENTPD5, ERBB2, F2, FOSB, GPT, IGF1, KRT7, L-triiodothyronine, LAMA3, LAMB3, LAMC2, LTA, LTB, MYLK, PDE8B, PDLM2, PRDX2, PRKD1, PTHR1, SQLE, ST3GAL4, TNF, UCP2	27	15	Connective Tissue Development and Function, Tissue Morphology, Cellular Development
ABCC3, AKR1B8 (includes EG:14187), ATF2, ATF3, ATP, CFD, cholesterol, CNDP2, CYB5B, CYP2E1, DBP, FGF2, FMO5, FOSL1, GCLC, GCLM, GDF15, HMGCR, hydrogen peroxide, IL1B, LAMA3, MT2A, MTHFD1L, P2RY2, P38 MAPK, PLA2G4A, PRKAA2, PRKD1, progesterone, SLC3A1, STARD5, TERT, TNFRSF17, TSPAN4, ursodeoxycholic acid	27	15	Cellular Growth and Proliferation, Cancer, Free Radical Scavenging
ABCC3, AMPK, Ap1, ARNTL, carbon monoxide, CLOCK, Cyclin B, CYP2E1, EZH2, glycerol, HMGCS2, IL6, KITLG (includes EG:4254), KLF2, LDLR, LEP, MAP3K7, MID1IP1,	22	13	Cancer, Cell Death, Nutritional Disease

Online Supporting Material

NFKB2, NGEF, PER2, PLK1, PRDX1, prostaglandin D2, RAC1, SC4MOL, SLC13A2, SRXN1, ST3GAL4, TEF, TNFRSF1B, TNFSF11, UCP2, USP2, WEE1

D. Upregulated genes at 6 months			
APLP1 (includes EG:333), CENTA1, COL8A1, CPEB1, CRY2, CTGF, CYP51A1, DBP, ES22, FOS, FRZB, GSTA3, GSTA5, GSTM6, GSTP1, HOXA7, ID3, JUNB, LMNA, MGST3, NQO1, PCYT2, PER1, PER2, SSTR2	49	25	Behavior, Nervous System Development and Function, Cellular Compromise
ARL2BP, CBR1, DGAT2, DHCR7, GNA11, GNB5, MVK, NGEF, NSDHL, PCSK9, PMVK, RASD2, SC4MOL, SQLE, SREBF2, TRIP10	27	16	Cardiovascular System Development and Function, Cell Signaling, Nervous System Development and Function
CCDC85B, CDK10, CYP2C18, DCXR, DECR2, DIO1, EMID1, KLF4, MPST, MUC1, PIB5PA, TM7SF3, TSPAN4, TST	22	14	Free Radical Scavenging, Molecular Transport, Cellular Growth and Proliferation
CBR3, CLDN4, CNDP2, FGFBP1, HMGCL, HSD17B7, IHH, KHK, LEFTY1, MEP1A, MGLL, MIR16, TSC22D1, VDAC3 AFM, AK1, AKR1B8 (includes EG:14187), CRIP1, DDAH2, LMNA, MID1IP1, NKX2-3, NOV, PPM1G, PTGS1, SLC27A2, TDO2	22 20	14 13	Cell Death, Reproductive System Disease, Organismal Development Cell Death, DNA Replication, Recombination, and Repair, Cell Cycle
ACAA1B, ACADS, ALDH1A7, ARPC1A, B4GALT3, CLDN4, ENTPD5, PF4, PLS3, SQLE, TCAP, TPPP	18	12	Cancer, Cellular Movement, Cell-To-Cell Signaling and Interaction
ADD1, DES, DUSP8, DUSP16, GADD45A, KLF4, MUC1, NEDD4, PTPRH, RHOD, RHOU	16	11	Cell Cycle, Cellular Movement, Cellular Assembly and Organization
AP1S1, CNN2, EIF2AK1, KRT17, PACSIN3, PDLIM2, RIPK4,	16	11	Amino Acid Metabolism, Post-

Online Supporting Material

SGK2, SLC25A1, SRPK3, TEF			Translational Modification, Small Molecule Biochemistry
E. Downregulated genes at 3 months			
ACTA2, Akt, AREG, CAV1, COL1A1, CTGF, EGFR, ELN, FBLN2, FBN1, GHR, Gpcr, GREM1, growth factor receptor, Igfbp, IGFBP2, IGFBP4, Integrin, Jnk, LOX, LOXL1, Mmp, MYOCD, Pdgf, PDGF BB, PLAT, PLEKHA1, PTN, Ras, RGS1, SERPINF1, Tgf beta, TNFRSF11A, TNFRSF12A, Vegf	45	23	Skeletal and Muscular System Development and Function, Cellular Movement, Cellular Growth and Proliferation
ADIG, CD2, CD274, CD1D, CD59A, CDR2, CPD, CXCL16, DBI, ENAH, HSPA1L, IFNG, LAMP1, LPIN1, ME1, MYC, NFIL3, NR1D1, PIGR, PPARG, progesterone, PSMC5, PSMD6, PSMD7, RFX1, RFX2, SCD, SDPR, SPSB1, TES, TFRC, TLE4, TSPO, TTC28, ZYX	40	21	Cell-To-Cell Signaling and Interaction, Cellular Growth and Proliferation, Hematological System Development and Function
ACLY, amino acids, B3GNT5, CENPA, COL5A1, COL7A1, CSRP1, DAD1, EMP3, ERBB2, F2, FBLN2, FGF10, ITGB4BP, LOC63928, LPIN1, MFAP2, NNMT, PARP3, PDLM4, PLEKHB1, PPAP2A, PTPRK, retinoic acid, RHOJ, SCD, SDF2, SDPR, SERPINH1, SPOCK1, TGFB1, TLE1, TMOD3, TPM4, TSPAN8	33	18	Tissue Development, Cancer, Cellular Growth and Proliferation
Adenylate Cyclase, ANXA5, Ap1, ARNTL-Clock, BAG2, BRD2, CCND2, CLOCK, COL18A1, COL4A1, COL5A1, CRY2, Cry-Period, Cyclin A, DUSP6, E2f, E2F2, EDN1, Gαi/o, ganglioside GD2, GNAI1, Histone h3, LGALS1, Mapk, Mek, MMP14, NR1D1, P38 MAPK, PI3K, Pka, Pkc(s), PPP1R1A, RGS4, SSTR3	28	16	Behavior, Cell Signaling, Nervous System Development and Function
BAG1, BIK, C10ORF58, CGI-38, COL4A1, CRYAB, DHFR, DNAJB1, HIST1H1C, HSPA1L, HSPA4L, HSPH1, HTRA1, ID1,	28	16	Cancer, Cellular Growth and Proliferation, Reproductive System

¹Biological Networks in upregulated, downregulated, and integrated total differentially expressed datasets (P -value < 0.05 , no FDR applied) were generated through the use of IPA. ²The network Score is based on the hypergeometric distribution and is calculated with the right-tailed Fisher's exact test. The score is the negative log of this P -value. (A score of greater than 2 indicates that there is a less than 1 in 100 chance that the Focus Genes were assembled into a network due to random chance alone.) ³Upward-pointing arrows indicate increased expression and downward-pointing arrows indicate decreased expression in the WD group (n=8) compared to Controls (n=8).
