Footnotes on table nomenclature:

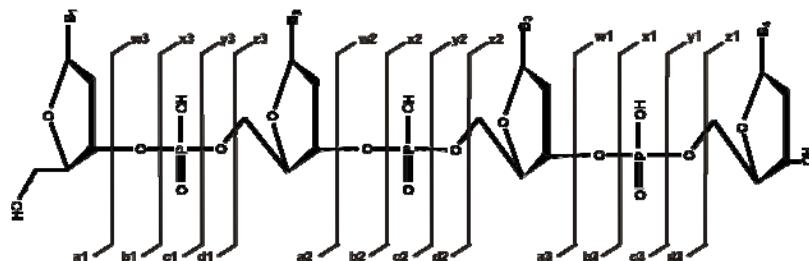

1. Oligonucleotide nomenclature:

G - Guanine

A - Adenine

C - Cytosine

T – Thymine

Scheme S1. Oligonucleotide fragmentation is specified in McLucky nomenclature (McLucky SA, Habibi-Goudarzi S. (1993) J. Am. Chem. Soc. 115: 12085-12095). In this table, tentative fragment ion assignments are given by the predominant fragmentation channels observed previously.

Scheme S2. Carbohydrate fragmentation is specified in Domon-Costello nomenclature (Domon B, Costello CE (1988) Glycoconjugate J 5: 397-409)

3. Lipid nomenclature :

Glycerophospholipids:

Ex. PC X:Y

PC, PE, PS = abbreviated names phosphatidylcholine, phosphatidylethanolamine, phosphatidylserine.

X = total number of carbons in fatty acid chains

Y = total number of double bonds in fatty acid chains

Sphingolipids:

Ex. SM (x:y)

SM, CB = abbreviated names sphingomyelin, cerebroside

x = total number of carbons in the amide linked fatty acid of the ceramide plus eighteen carbons from the sphingosine backbone

y = total number of double bonds, one trans double bond in the sphingosine backbone plus the number of double bonds in the amide linked fatty acid of the ceramide

() = used to distinguish sphingolipid from glycerophospholipid nomenclature in the table

Hydroxylation on Cerebrosides:

Ex. CB (x:y)h

h = denotes hydroxylation on the number two carbon (from carbonyl) of the amide linked fatty acid.
