

Supplementary Data

Figure S1. Controls of Δ Np63 isoforms overexpression. Western Blot analysis performed with a pan-p63 antibody on total extracts from H1299 (left) and MCF-7 (right) cells transfected with pcDNA3 vectors expressing the cDNAs of each Δ Np63 isoform, to detect the intracellular levels of exogenously expressed isoforms. The lower bands observed in ectopically expressed Δ Np63 δ and Δ Np63 ϵ are likely due to an alternative initiation of translation, downstream the first ATG (22). The molecular weights of protein markers are shown on the left.
