

Supplementary Figure 1. Coriell DNA sample identifiers, along with the place of origin of the DNA samples, are shown at left. At right are genotype data from resequencing of the coding region of *GYPC*. Variable sites are listed by their dbSNP identifier or position in build hg18 of the human genome sequence for sites not in the dbSNP database. All sites fall within non-coding regions of the gene except for the position marked with a single asterisk (which indicates a synonymous variant) and the position marked with a double asterisk (which indicates a non-synonymous variant). Blue boxes indicate homozygosity for the ancestral allele (inferred from comparison with *P. troglodytes*), yellow indicates homozygosity for the derived allele, and red indicates heterozygotes.
