Figure S1. Expression levels of β_{2a} or $\text{Ca}_v1.2$ Ca^{2+} -channel subunits in hearts of transgenic animals. **a**, Induction of the β_{2a} -subunit by tebufenozide treatment. mRNA copy number of endogenous murine β_2 -subunit and overexpressed rat β_{2a} -subunit. $\text{tg}_{\text{ind}} \beta_{2a}$ and double-transgenic mice showed approximately 100-fold overexpression of the β_2 -subunit compared to wild-type and $\text{tg} \text{Ca}_v1.2$ mice upon tebufenozide treatment (n=5-15 per genotype, ***p<0.001). **b**, Overexpression of human $\text{Ca}_v1.2$ -subunit. No differences were observed in mRNA expression levels between $\text{tg} \text{Ca}_v1.2$ and $\text{tg} \text{Ca}_v1.2 \times \text{tg}_{\text{ind}} \beta_{2a}$ mice (n=8-9 per genotype).

Figure S2: Gating of single ventricular L-type Ca^{2+} -channels at +20 mV. At this more depolarized test potential the lower basal activity in myocytes from $\text{tg} \text{Ca}_v1.2$ is confirmed. In accordance with the leftward shift at the whole-cell level (Figure 1), effects of β_{2a} overexpression on single-channel gating are less pronounced at +20 mV compared to +10 mV (cf. Figure 2) (wild-type: n=8, $\text{tg}_{\text{ind}} \beta_{2a}$: n=7, $\text{tg} \text{Ca}_v1.2$: n=6, $\text{tg} \text{Ca}_v1.2 \times \text{tg}_{\text{ind}} \beta_{2a}$: n=8, * p<0.05; ** p<0.01).

Figure S3: Effects of cAMP-stimulation on Ca^{2+} currents in ventricles overexpressing a β_{2a} subunit. Exemplary traces and time courses of ventricular whole-cell Ca^{2+} currents reveal a clear-cut increase of peak current following application of 8-Br-cAMP (1mM) and okadaic acid (1 μ M) in wild-type (**a, b**) myocytes. This effect was blunted in cardiomyocytes from mice overexpressing the cardiac β_2 -subunit ($\text{tg}_{\text{ind}} \beta_{2a}$; **d, e**). Current increase was statistically significant in case of wild-type (n=6) but not $\text{tg}_{\text{ind}} \beta_{2a}$ myocytes (n=5) (**c, f**).
