

Figure S2. α PS1 β PS mediates the downregulation of actin nucleating factors
All micrographs show clones of cells lacking α PS1 marked by the absence of GFP (no green) at stage 12. A-C show the merge of channels for actin (red), GFP (green) and different actin nucleating proteins (blue), also shown in grey (A'-C'). As in the absence of β PS (Figure 4), profilin (A-A'), Enabled (B-B') and Diaphanous (C-C') were elevated in the absence of α PS1. Scale bar, 20 μ m.
