

Supplementary figure S1 – GR-1 expression by Mac-1⁺CD4⁻CD8⁻B220⁻ cells in the liver of unchallenged and challenged chronic mice. C57BL/6 mice infected for 7 months with *T. cruzi* parasites were challenged i.v. with 5x10⁶ homologous trypomastigotes and, after 48 h, the liver leukocytes analyzed by flow cytometry. Control and chronic mice were also included. GR-1 expression by gated Mac1⁺CD4⁻CD8⁻B220⁻. Numbers indicate the mean ± SD of percentages of cells with low, intermediate and high GR-1 expression. Representative histograms of one experiment (n=3) out of two are shown.
