

Supplementary figure S2 – Frequency of large cells among CD4⁺ and CD8⁺ cells in the liver of unchallenged and challenged chronic mice. C57BL/6 mice infected for 7 months with *T. cruzi* parasites were challenged i.v. with 5×10^6 homologous trypomastigotes and, after 24 and 48 h, the liver leukocytes analyzed by flow cytometry. Frequency of large cells in gated CD4⁺ cells (upper) and gated CD8⁺ cells (lower). Numbers in histograms indicate the mean frequencies of large cells in each subset. Representative histograms of one experiment (n=3) out of two are shown.
