Primary rat  $\beta$ -cells were left untreated or exposed to IL1 $\beta$ +IFN- $\gamma$  (IL+IFN) for 6h. Data are mean of three independent experiments and are expressed as fold change versus control cells, studied at the same time point

Gene expression was considered modified by treatment when  $P \leq 0.02$  (paired *t-test*) and expression level  $\geq 1.5$  fold higher or lower as compared to control conditions.

Pval = p value of Student t-test against control condition at the same time point. Some genes are represented by more than one probe. Classification was done using the IPA software
