Supplemental figure legends

Supplemental Figure 1. GFP-Mob1C and Mob1D localization in Hela cells.

HeLa cells were transfected with GFP-Mob1C and Mob1D, and were fixed 24 hr post-transfection. Panels A-H show optical sections of cells in prometaphase, metaphase, anaphase, and late cytokinesis, respectively. Bar, 10 μ m.

Supplemental Figure 2. Localization of GFP-tagged and endogenous Mob1A.

A. HeLa cells transiently expressing GFP-Mob1A were counterstained for endogenous Mob1A with an antibody directed against the N-terminus of MobKL1B (A-L). Additionally, HeLa cells processed for endogenous Mob1 and tubulin (M-O) to visualize Mob1 localization in the absence of the GFP-tagged construct. Note that in the optical sections shown in Panels A, D and M, one or both spindle poles are not visible in the focal plane. Bar, 10 μ m. **B.** Confirmation of the specificity of the Mob1A antibody was confirmed by western blot. **C.** Transient expression of untagged EGFP in HeLa cells. Bar, 10 μ m.

Supplemental Figure 3: Regulation of Mob1C and Mob1D recruitment to spindle poles.

GFP-Mob1C and GFP-Mob1D-expressing HeLa cells were transfected with non-targeting control (left panels)- and Plk1 siRNA (right panels). Twenty-four hours post-siRNA transfection, cells were processed for localization of γ tubulin and Plk1. Similar to Mob1A, in the absence of Plk1, cells formed a monopolar spindle, and while both

Mob1C and Mob1D localization was lost from the centrally located spindle pole while kinetochore localization was unaffected (D, J, O and U). Bar, 10 μ m.

Supplemental Figure 4: Confirmation of Plk1 and INCENP depletion in HeLa cells.

GFP-Mob1A-expressing HeLa cells were transfected with non-targeting control, Plk1, or INCENP siRNA. Twenty-four hours post-siRNA transfection, cells were lysed for Western blotting and probed for the target proteins, and then reprobed for tubulin as a loading control.

Supplemental Figure 5. Regulation of Mob1C and Mob1D recruitment to kinetochores.

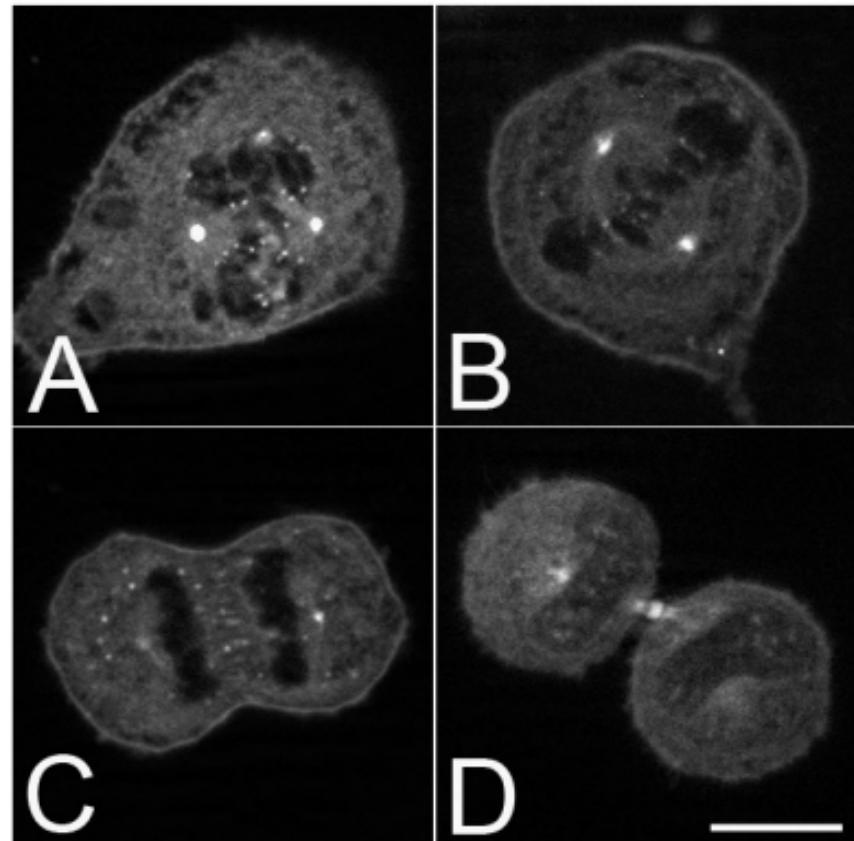

GFP-Mob1C and GFP-Mob1D-expressing HeLa cells were transfected with non-targeting control and INCENP siRNA. Twenty-four hours post- transfection, cells were processed for localization of Hec1 and INCENP. As was found with GFP-Mob1A, when INCENP was depleted, Mob1C and Mob1D no longer localized on the kinetochore, but spindle pole localization was unaffected (D, J, O and U). Bar, 10 μ m.

Supplemental Figure 6: Mob1C and Mob1D localization to the kinetochore is lost when Aurora B is inhibited.

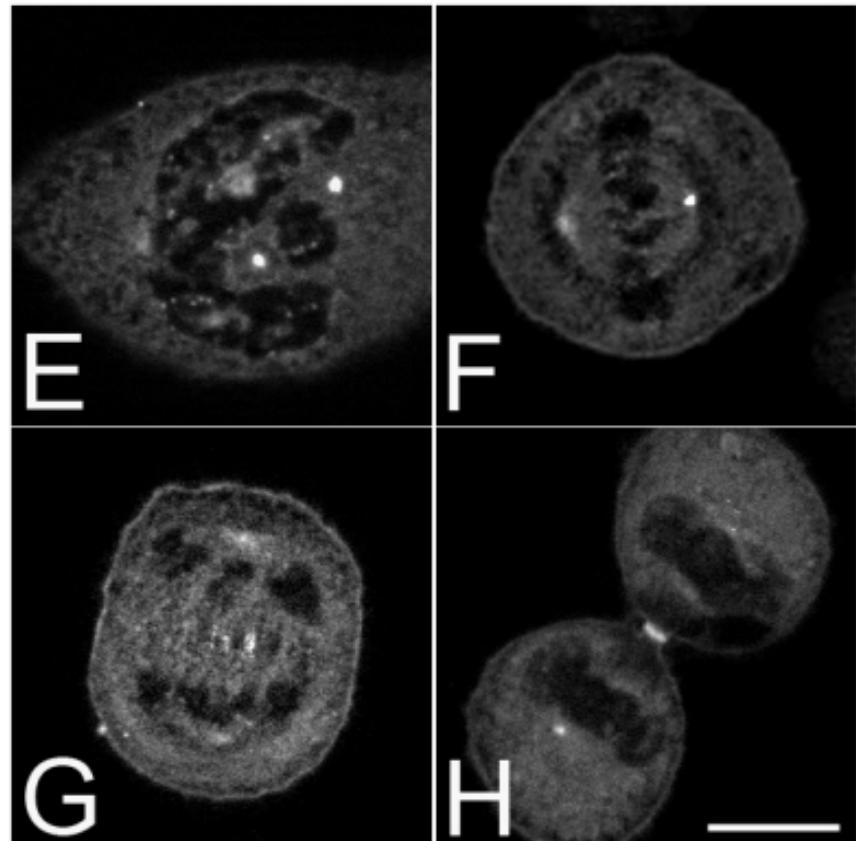

GFP-Mob1C and GFP-Mob1D-expressing HeLa cells were transfected were treated with 200nM nocodazole for 3hr, and then released into 0.1% DMSO (A-D and I-L) or 5 μ M ZM477439 (E-H and M-P) for an additional 30min. Cells were fixed and counter-stained with phospho- (Ser10) histone H3 (B, F, J and N). Note that while spindle pole

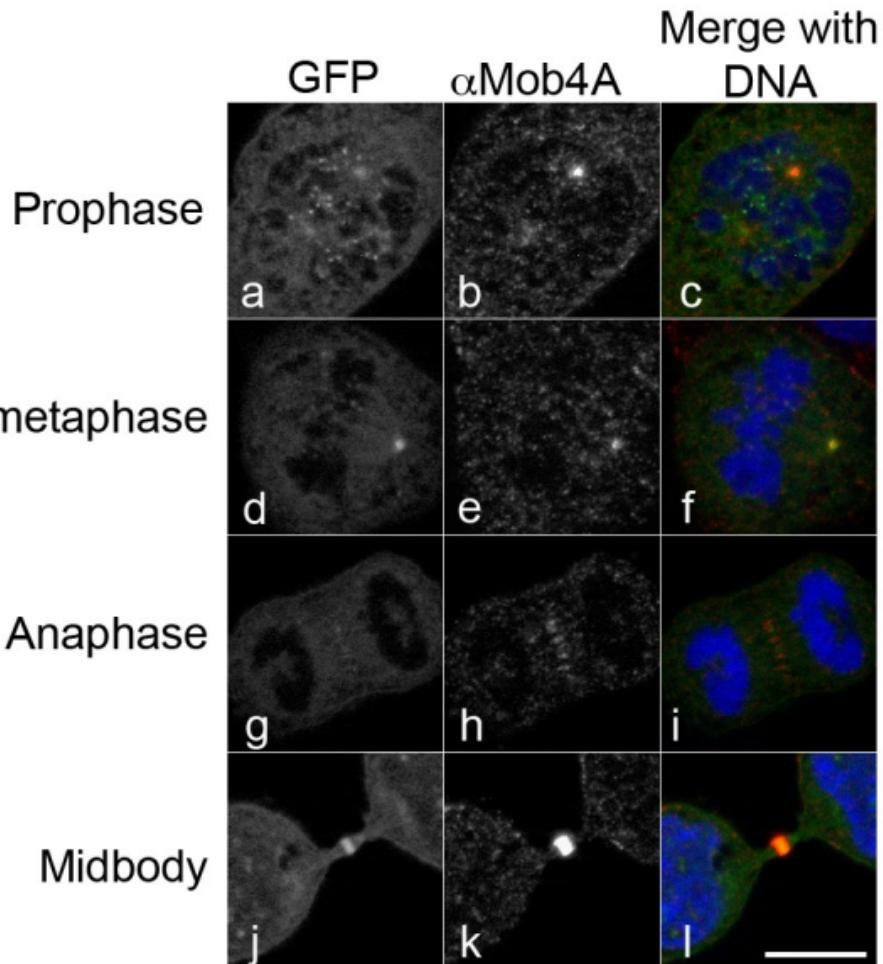

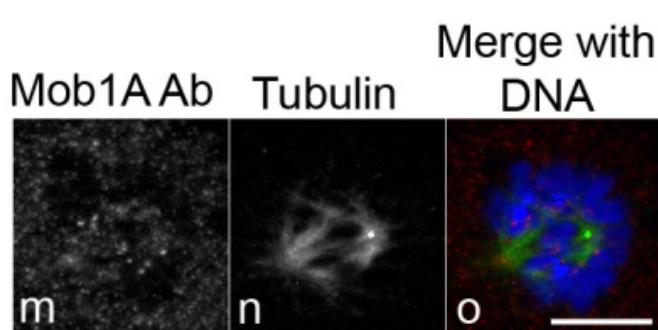

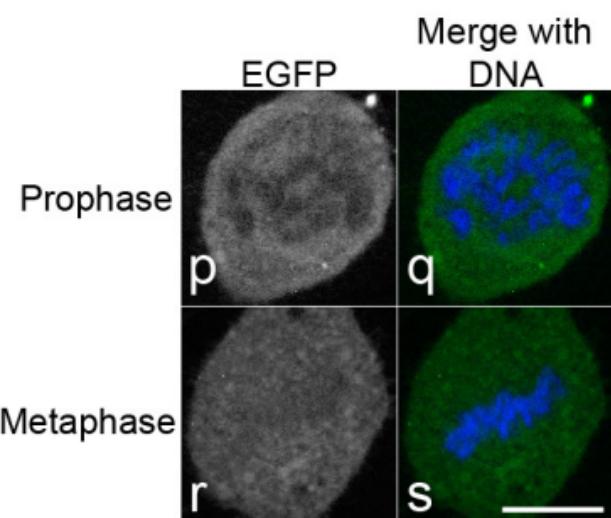

localization was maintained in cells with compromised Aurora B activity, kinetochore localization was lost (E and M). Bar, 5 μ m.
