Degradation and Negative control probes have been used to define background level. Mismatch probes have been designed by the Combimatrix Company for each perfect match probe, to assess the quality of each hybridization. For each miRNA precursor molecules many different probes have been designed. In particular there are probes designed on the predicted mature miRNA; probes designed on the predicted miRNA\* (marked as |\*); probes shifted of 5 or 10 nucleotide towards the 5' (|+5 and |+10) or the 3' (|-5 and |-10) with respect to the start of the expected mature miRNA; probes shifted of 5 or 10 nucleotide towards the 5' (|\*+5 and |\*+10) or the 3' (|\*-5 and |\*-10) with respect to the start of the expected mature miRNA\*, probes of exactly 20 nucleotide designed on the predicted miRNA, when longer than 20nt (|0); probes of exactly 20 nucleotide designed on the predicted miRNA\*, when longer than 20nt (|\*0), probes designed on the precursor sequence, outside the miRNA or miRNA\* region (|ctrl) and finally complementary probes to the miRNA probe (|compl) and to the miRNA\* (|\*compl).
