

Supplementary information, Figure S1 Death stimulus-induced mitochondrial translocation of Bax is independent of Puma. Blockade of the transcriptional arm of the p53 response with α -amanitin (α Am) does not interfere with Bax translocation to the outer mitochondrial membrane. Moreover, Puma is dispensable for this event. HCT116 *p21*^{-/-} *PUMA*^{-/-} cells were treated as indicated in Figure 1D and immunostained with antibodies against mtsp70 (green) and N-terminal specific Bax (red). The merged images show co-localization of mtsp70 and Bax in yellow.
